

Software Interface

CCURPMFC (WC-CP-FIO)

PCIe Programmable Multi-Function I/O Card (MIOC)

<i>Driver</i>	ccurpmfc (WC-CP-FIO)	v 23.0.5
<i>OS</i>	RedHawk (CentOS or Ubuntu based)	5.4, 6.0, 6.3, 6.5, 7.0, 7.2 7.3 and 7.5
<i>Vendor</i>	Concurrent Real-Time	
<i>Hardware</i>	PCIe Programmable Multi-Function Card (CP-FPGA-Ax)	
<i>Date</i>	August 9 th , 2018

1. Introduction

This document provides the software interface to the *ccurpmfc* driver which communicates with the Concurrent Real-Time PCI Express Programmable Multi-Function FPGA I/O Card (MIOC). For additional information on programming, please refer to the *Concurrent Real-Time PCIe Programmable Multi-Function I/O Cards (MIOC) Design Specification (No. 0610104)* document.

The software package that accompanies this board provides the ability for advanced users to communicate directly with the board via the driver *ioctl(2)* and *mmap(2)* system calls. When programming in this mode, the user needs to be intimately familiar with both the hardware and the register programming interface to the board. Failure to adhere to correct programming will result in unpredictable behavior.

Additionally, the software package is accompanied with an extensive set of application programming interface (API) calls that allow the user to access all capabilities of the board. The API library also allows the user the ability to communicate directly with the board through the *ioctl(2)* and *mmap(2)* system calls. In this case, there is a risk of this direct access conflicting with API calls and therefore should only be used by advanced users who are intimately familiar with the hardware, board registers and the driver code.

Various example tests have been provided in the *test* and *test/lib* directories to assist the user in developing their applications.

- PCIe Programmable Multi-Function Card I/O (MIOC) Design Specification (No. 0610104) by Concurrent Real-Time.

2. Software Support

Software support is provided for users to communicate directly with the board using the kernel system calls (*Direct Driver Access*) or the supplied *API*. Both approaches are identified below to assist the user in software development.

2.1 Direct Driver Access

2.1.1 open(2) system call

In order to access the board, the user first needs to open the device using the standard system call *open(2)*.

```
int      fp;
fp = open("/dev/ccurpmfc0", O_RDWR);
```

The file pointer '*fp*' is then used as an argument to other system calls. The user can also supply the *O_NONBLOCK* flag if the user does not wish to block waiting for reads to complete. In that case, if the read is not satisfied, the call will fail. The device name specified is of the format "/dev/ccurpmfc<num>" where *num* is a digit 0..9 which represents the board number that is to be accessed. Basically, the driver only allows one application to open a board at a time. The reason for this is that the application can have full access to the card, even at the board and API level. If another application were to communicate with the same card concurrently, the results would be unpredictable unless proper synchronization between applications is performed external to the driver. This driver allows multiple applications to open the same board by specifying the additional *oflag* *O_APPEND*. It is then the responsibility of the user to ensure that the various applications communicating with the same cards are properly synchronized. Various tests supplied in this package has the *O_APPEND* flags enabled, however, it is strongly recommended that only one application be

used with a single card at a time, unless the user is well aware of how the applications are going to interact with each other and accept any unpredictable results.

2.1.2 ioctl(2) system call

This system call provides the ability to control and get responses from the board. The nature of the control/response will depend on the specific *ioctl* command.

```
int    status;
int    arg;
status = ioctl(fp, <IOCTL_COMMAND>, &arg);
```

where, ‘fp’ is the file pointer that is returned from the *open(2)* system call. <IOCTL_COMMAND> is one of the *ioctl* commands below and *arg* is a pointer to an argument that could be anything and is dependent on the command being invoked. If no argument is required for a specific command, then set to *NULL*.

Driver IOCTL command:

```
IOCTL_CCURPMFC_ABORT_DMA
IOCTL_CCURPMFC_ADD_IRQ
IOCTL_CCURPMFC_DISABLE_PCI_INTERRUPTS
IOCTL_CCURPMFC_ENABLE_PCI_INTERRUPTS
IOCTL_CCURPMFC_GET_DRIVER_ERROR
IOCTL_CCURPMFC_GET_DRIVER_INFO
IOCTL_CCURPMFC_GET_PHYSICAL_MEMORY
IOCTL_CCURPMFC_GET_ADC_READ_MODE
IOCTL_CCURPMFC_GET_DAC_WRITE_MODE
IOCTL_CCURPMFC_INIT_BOARD
IOCTL_CCURPMFC_INTERRUPT_TIMEOUT_SECONDS
IOCTL_CCURPMFC_MMAP_SELECT
IOCTL_CCURPMFC_NO_COMMAND
IOCTL_CCURPMFC_PCI_CONFIG_REGISTERS
IOCTL_CCURPMFC_REMOVE_IRQ
IOCTL_CCURPMFC_RESET_BOARD
IOCTL_CCURPMFC_SELECT_ADC_READ_MODE
IOCTL_CCURPMFC_SELECT_DAC_WRITE_MODE
IOCTL_CCURPMFC_WAIT_FOR_INTERRUPT
IOCTL_CCURPMFC_WAIT_FOR_DAC_FIFO_TO_DRAIN
IOCTL_CCURPMFC_RELOAD_FIRMWARE
IOCTL_CCURPMFC_GET_ALL_BOARDS_DRIVER_INFO
IOCTL_CCURPMFC_WAKEUP_DIO_COS_INTERRUPT
IOCTL_CCURPMFC_WAIT_FOR_DIO_COS_INTERRUPT
```

IOCTL_CCURPMFC_ABORT_DMA: This *ioctl* does not have any arguments. Its purpose is to abort any DMA already in progress..

IOCTL_CCURPMFC_ADD IRQ: This *ioctl* does not have any arguments. Its purpose is to setup the driver *interrupt handler* to handle interrupts. If support for MSI interrupts are configured, they will be enabled. Normally, there is no need to call this *ioctl* as the interrupt handler is already added when the driver is loaded. This *ioctl* should only be invoked if the user has issued the *IOCTL_CCURPMFC_REMOVE_IRQ* call earlier to remove the interrupt handler.

IOCTL_CCURPMFC_DISABLE PCI_INTERRUPTS: This *ioctl* does not have any arguments. Its purpose is to disable PCI interrupts. This call shouldn’t be used during normal reads or writes, as calls could time out. The driver handles enabling and disabling interrupts during its normal course of operation.

IOCTL_CCURPMFC_ENABLE_PCI_INTERRUPTS: This *ioctl* does not have any arguments. Its purpose is to enable PCI interrupts. This call shouldn't be used during normal reads or writes as calls could time out. The driver handles enabling and disabling interrupts during its normal course of operation.

IOCTL_CCURPMFC_GET_DRIVER_ERROR: The argument supplied to this *ioctl* is a pointer to the *ccurpmfc_user_error_t* structure. Information on the structure is located in the *ccurpmfc_user.h* include file. The error returned is the last reported error by the driver. If the argument pointer is *NULL*, the current error is reset to *CCURPMFC_SUCCESS*.

IOCTL_CCURPMFC_GET_DRIVER_INFO: The argument supplied to this *ioctl* is a pointer to the *ccurpmfc_driver_info_t* structure. Information on the structure is located in the *ccurpmfc_user.h* include file. This *ioctl* provides useful driver information.

IOCTL_CCURPMFC_GET_PHYSICAL_MEMORY: The argument supplied to this *ioctl* is a pointer to the *ccurpmfc_user_phys_mem_t* structure. Information on the structure is located in the *ccurpmfc_user.h* include file. If physical memory is not allocated, the call will fail; otherwise the call will return the physical memory address and size in bytes. The only reason to request and get physical memory from the driver is to allow the user to perform DMA operations and bypass the driver and library. Care must be taken when performing user level DMA, as incorrect programming could lead to unpredictable results, including but not limited to corrupting the kernel and any device connected to the system.

IOCTL_CCURPMFC_GET_ADC_READ_MODE: The argument supplied to this *ioctl* is a pointer to an *unsigned long int*. The value returned will be one of the ADC read modes as defined by the *enum_ccurpmfc_driver_ADC_read_mode_t* located in the *ccurpmfc_user.h* include file.

IOCTL_CCURAOCGET_DAC_WRITE_MODE: The argument supplied to this *ioctl* is a pointer to an *unsigned long int*. The value returned will be one of the DAC write modes as defined by the *enum_ccurpmfc_driver_DAC_write_mode_t* located in the *ccurpmfc_user.h* include file.

IOCTL_CCURPMFC_INIT_BOARD: This *ioctl* does not have any arguments. This call resets the board to a known initial default state. This call is currently identical to the *IOCTL_CCURPMFC_RESET_BOARD* call.

IOCTL_CCURPMFC_INTERRUPT_TIMEOUT_SECONDS: The argument supplied to this *ioctl* is a pointer to an *int*. It allows the user to change the default time out from 30 seconds to user supplied time out. This is the time that the read call will wait before it times out. The call could time out if a DMA fails to complete. The device should have been opened in the block mode (*O_NONBLOCK* not set) for reads to wait for an operation to complete.

IOCTL_CCURPMFC_MMAP_SELECT: The argument to this *ioctl* is a pointer to the *ccurpmfc mmap_select_t* structure. Information on the structure is located in the *ccurpmfc_user.h* include file. This call needs to be made prior to the *mmap(2)* system call so as to direct the *mmap(2)* call to perform the requested mapping specified by this *ioctl*. The four possible mappings that are performed by the driver are to *mmap* the local register space (*CCURPMFC_SELECT_LOCAL_MMAP*), the configuration register space (*CCURPMFC_SELECT_CONFIG_MMAP*) the physical memory (*CCURPMFC_SELECT_PHYS_MEM_MMAP*) that is created by the *mmap(2)* system call and the driver/library mapping (*CCURPMFC_SELECT_DRIVER_LIBRARY_MMAP*).

IOCTL_CCURPMFC_NO_COMMAND: This *ioctl* does not have any arguments. It is only provided for debugging purpose and should not be used as it serves no purpose for the application.

IOCTL_CCURPMFC_PCI_CONFIG_REGISTERS: The argument supplied to this *ioctl* is a pointer to the *ccurpmfc_pci_config_reg_addr_mapping_t* structure whose definition is located in the *ccurpmfc_user.h* include file.

IOCTL_CCURPMFC_REMOVE IRQ: This *ioctl* does not have any arguments. Its purpose is to remove the interrupt handler that was previously setup. The interrupt handler is managed internally by the driver and the library. The user should not issue this call, otherwise reads will time out.

IOCTL_CCURPMFC_RESET BOARD: This *ioctl* does not have any arguments. This call resets the board to a known initial default state. This call is currently identical to the ***IOCTL_CCURPMFC_INIT_BOARD*** call.

IOCTL_CCURPMFC_SELECT ADC READ MODE: The argument supplied to this *ioctl* is a pointer to an *unsigned long int*. The value set will be one of the ADC read modes as defined by the *enum_ccurpmfc_driver_ADC_read_mode_t* located in the *ccurpmfc_user.h* include file.

IOCTL_CCURAOC SELECT DAC WRITE MODE: The argument supplied to this *ioctl* is a pointer to an *unsigned long int*. The value set will be one of the DAC write modes as defined by the *enum_ccurpmfc_driver_DAC_write_mode_t* located in the *ccurpmfc_user.h* include file.

IOCTL_CCURPMFC_WAIT FOR INTERRUPT: The argument to this *ioctl* is a pointer to the *ccurpmfc_driver_int_t* structure. Information on the structure is located in the *ccurpmfc_user.h* include file. The user can wait for a DMA or Analog signal complete interrupt. If a time out value greater than zero is specified, the call will time out after the specified seconds, otherwise it will not time out.

IOCTL_CCURPMFC_WAIT FOR DAC FIFO TO DRAIN: The argument to this *ioctl* is a pointer to *threshold*. The call will block until the samples in the DAC FIFO falls below the threshold value.

IOCTL_CCURPMFC_RELOAD FIRMWARE: This *ioctl* does not have any arguments. This call performs a reload of the latest firmware that was loaded into the board. Typically, this is used after a new firmware has been installed. It eliminates the need to reboot the kernel after a firmware update.

IOCTL_CCURPMFC_GET ALL BOARDS DRIVER INFO: The argument to this *ioctl* is a pointer to *ccurpmfc_all_boards_driver_info*. It provides the ability to supply all driver information for all the *ccurpmfc* cards in the system to the user.

IOCTL_CCURPMFC_WAKEUP_DIO_COS_INTERRUPT: This *ioctl* does not have any arguments. The purpose of this call is to wake up a process that is blocked using the ***IOCTL_CCURPMFC_WAIT_FOR_DIO_COS_INTERRUPT*** *ioctl* waiting for a DIO change-of-state interrupt.

IOCTL_CCURPMFC_WAIT FOR DIO COS INTERRUPT: The argument to this *ioctl* is a pointer to the *ccurpmfc_driver_dio_cos_int_t* structure. Information on the structure is located in the *ccurpmfc_user.h* include file. The user can wait for a DIO complete interrupt with the *WakeupInterruptMas* mask. This call blocks indefinitely until a DIO change-of-state interrupt occurs. If a change-of-state interrupt occurs, this call returns useful DIO related statistics to the user. To cancel a pending wait, users can use the ***IOCTL_CCURPMFC_WAKEUP_DIO_COS_INTERRUPT*** *ioctl()* call.

2.1.3 mmap(2) system call

This system call provides the ability to map either the local board registers, the configuration board registers, create and map a physical memory that can be used for user DMA or driver/library structure mapping. Prior to making this system call, the user needs to issue the *ioctl(2)* system call with the ***IOCTL_CCURPMFC_MMAP_SELECT*** command. When mapping either the local board registers or the configuration board registers, the *ioctl* call returns the size of the register mapping which needs to be specified in the *mmap(2)* call. In the case of mapping a physical memory, the size of physical memory to be created is supplied to the *mmap(2)* call.

```
int *munmap_local_ptr;
ccurpmfc_local_ctrl_data_t *local_ptr;
ccurpmfc_mmap_select_t mmap_select;
unsigned long mmap_local_size;
```

```

mmap_select.select = CCURPMFC_SELECT_LOCAL_MMAP;
mmap_select.offset=0;
mmap_select.size=0;
ioctl(fp, IOCTL_CCURPMFC_MMAP_SELECT, (void *)&mmap_select);
mmap_local_size = mmap_select.size;

munmap_local_ptr = (int *) mmap((caddr_t)0, map_local_size,
                                (PROT_READ|PROT_WRITE), MAP_SHARED, fp, 0);

local_ptr = (ccurpmfc_local_ctrl_data_t *)munmap_local_ptr;
local_ptr = (ccurpmfc_local_ctrl_data_t *)((char *)local_ptr +
                                             mmap_select.offset);

.

.

if(munmap_local_ptr != NULL)
    munmap((void *)munmap_local_ptr, mmap_local_size);

```

2.1.4 read(2) system call

This system call currently supports ADC programmed I/O reads of channel registers and FIFO. The option selected is determined by the *ccurPMFC_ADC_Set_Driver_Read_Mode()* call.

CCURPMFC_ADC_PIO_CHANNEL: Perform .channel registers programmed I/O reads.

CCURPMFC_ADC_PIO_FIFO: Perform FIFO reads using programmed I/O.

2.1.5 write(2) system call

This system call currently supports DAC programmed I/O writes of channel registers and FIFO. The option selected is determined by the *ccurPMFC_DAC_Set_Driver_Write_Mode()* call.

CCURPMFC_DAC_PIO_CHANNEL: Perform .channel registers programmed I/O writes.

CCURPMFC_DAC_PIO_FIFO: Perform FIFO writes using programmed I/O.

2.2 Application Program Interface (API) Access

The API is the recommended method of communicating with the board for most users.

There are a lot of APIs that have multiple arguments to set various parameters. If the user only wishes to change certain parameters for the call, they need to get the current settings via a query API, change only those parameters that need to be modified and then invoke a setting API to update these parameters (*i.e.* *read/modify/write*). This is a two API call operation.

A nice feature has been implemented in these APIs to simplify the user programming by having a common parameter CCURPMFC_DO_NOT_CHANGE which is a #define, that can be used for a lot of these calls. Arguments with this parameter will therefore cause the API to perform the read/modify/write operation instead of the user performing the same function with two API calls. The drawback to this approach is that some compilers will complain about the use of this parameter and therefore the user will require appropriate casting to get rid of warnings/errors.

The following are a list of calls that are available.

```
ccurPMFC_Abort_DMA()
ccurPMFC_ADC_Activate()
ccurPMFC_ADC_Get_CSR()
ccurPMFC_ADC_Get_Driver_Read_Mode()
ccurPMFC_ADC_Get_Fifo_Channel_Select()
ccurPMFC_ADC_Get_Fifo_Info()
ccurPMFC_ADC_Get_Fifo_Threshold()
ccurPMFC_ADC_Get_Negative_Cal()
ccurPMFC_ADC_Get_Offset_Cal()
ccurPMFC_ADC_Get_Positive_Cal()
ccurPMFC_ADC_Perform_Auto_Calibration()
ccurPMFC_ADC_Perform_External_Negative_Calibration()
ccurPMFC_ADC_Perform_External_Offset_Calibration()
ccurPMFC_ADC_Perform_External_Positive_Calibration()
ccurPMFC_ADC_Perform_Negative_Calibration()
ccurPMFC_ADC_Perform_Offset_Calibration()
ccurPMFC_ADC_Perform_Positive_Calibration()
ccurPMFC_ADC_Read_Channels()
ccurPMFC_ADC_Read_Channels_Calibration()
ccurPMFC_ADC_Reset_Fifo()
ccurPMFC_ADC_Set_CSR()
ccurPMFC_ADC_Set_Driver_Read_Mode()
ccurPMFC_ADC_Set_Fifo_Channel_Select()
ccurPMFC_ADC_Set_Fifo_Threshold()
ccurPMFC_ADC_Set_Negative_Cal()
ccurPMFC_ADC_Set_Offset_Cal()
ccurPMFC_ADC_Set_Positive_Cal()
ccurPMFC_ADC_Write_Channels_Calibration()
ccurPMFC_Add_Irq()
ccurPMFC_BoardExpirationTimeRemaining()
ccurPMFC_Clear_Driver_Error()
ccurPMFC_Clear_Lib_Error()
ccurPMFC_Clock_Generator_Soft_Reset()
ccurPMFC_Clock_Get_Generator_CSR()
ccurPMFC_Clock_Get_Generator_Info()
ccurPMFC_Clock_Get_Generator_Input_Clock_Enable()
ccurPMFC_Clock_Get_Generator_Input_Clock_Select()
ccurPMFC_Clock_Get_Generator_Input_Clock_Status()
ccurPMFC_Clock_Get_Generator_M_Divider()
```

```

ccurPMFC_Clock_Get_Generator_N_Divider()
ccurPMFC_Clock_Get_Generator_Output_Config()
ccurPMFC_Clock_Get_Generator_Output_Format()
ccurPMFC_Clock_Get_Generator_Output_Mode()
ccurPMFC_Clock_Get_Generator_Output_Mux()
ccurPMFC_Clock_Get_Generator_P_Divider()
ccurPMFC_Clock_Get_Generator_P_Divider_Enable()
ccurPMFC_Clock_Get_Generator_R_Divider()
ccurPMFC_Clock_Get_Generator_Revision()
ccurPMFC_Clock_Get_Generator_Value()
ccurPMFC_Clock_Get_Generator_Voltage_Select()
ccurPMFC_Clock_Get_Generator_Zero_Delay()

2.2.1 ccurPMFC_Abort_DMA()

This call will abort any DMA operation that is in progress. Normally, the user should not use this call unless they are providing their own DMA handling.

```
*****
    _ccurpmfc_lib_error_number_t ccurPMFC_Abort_DMA(void *Handle)

    Description: Abort any DMA in progress

    Input:    void *Handle                               (Handle pointer)
    Output:   none
    Return:   _ccurpmfc_lib_error_number_t
              # CCURPMFC_LIB_NO_ERROR           (successful)
              # CCURPMFC_LIB_BAD_HANDLE        (no/bad handler supplied)
              # CCURPMFC_LIB_NOT_OPEN         (device not open)
              # CCURPMFC_LIB_NO_LOCAL_REGION  (local region not present)
              # CCURPMFC_LIB_IOCTL_FAILED     (driver ioctl call failed)
*****

```

2.2.2 ccurPMFC_ADC_Activate()

This call must be the first call to activate the ADC. Without activation, all other calls will fail. The user can also use this call to return the current state of the ADC without any change.

```
*****
    _ccurpmfc_lib_error_number_t
    ccurPMFC_ADC_Activate (void                                *Handle,
                           _ccurpmfc_adc_all_enable_t  activate,
                           _ccurpmfc_adc_all_enable_t *current_state)

    Description: Activate/DeActivate ADC module

    Input:    void                                     *Handle      (Handle pointer)
              _ccurpmfc_adc_all_enable_t  activate      (activate/deactivate)
              # CCURPMFC_ADC_ALL_DISABLE
              # CCURPMFC_ADC_ALL_ENABLE
              # CCURPMFC_ADC_ALL_DO_NOT_CHANGE
    Output:   _ccurpmfc_adc_all_enable_t      *current_state (active/deactive)
              # CCURPMFC_ADC_ALL_DISABLE
              # CCURPMFC_ADC_ALL_ENABLE
    Return:   _ccurpmfc_lib_error_number_t
              # CCURPMFC_LIB_NO_ERROR           (successful)
              # CCURPMFC_LIB_BAD_HANDLE        (no/bad handler supplied)
              # CCURPMFC_LIB_NOT_OPEN         (device not open)

         # CCURPMFC_LIB_CLOCK_IS_NOT_ACTIVE (Clock is not active)
*****

```

2.2.14 ccurPMFC_ADC_Perform_External_Positive_Calibration()

Use this call to perform an external positive calibration. Prior to calling this function, the ADC inputs must be provided with a positive signal close to +10 Volts, otherwise this call will fail. Additionally, the user can specify a range of channels.

```
*****
    _ccurpmfc_lib_error_number_t
    ccurPMFC_ADC_Perform_External_Positive_Calibration(void          *Handle,
                                                       _ccurpmfc_adc_channel_t chan_start,
                                                       _ccurpmfc_adc_channel_t chan_end,
                                                       double                  ReferenceVoltage)

Description: Perform ADC External Positive Calibration

Input:   void           *Handle          (handle pointer)
         _ccurpmfc_adc_channel_t chan_start  (start channel)
         _ccurpmfc_adc_channel_t chan_end    (end channel)
         double                  ReferenceVoltage (Reference Voltage)
Output:  none
Return:  _ccurpmfc_lib_error_number_t
         # CCURPMFC_LIB_NO_ERROR          (successful)
         # CCURPMFC_LIB_BAD_HANDLE        (no/bad handler supplied)
         # CCURPMFC_LIB_NOT_OPEN         (library not open)
         # CCURPMFC_LIB_INVALID_ARG      (invalid argument)
         # CCURPMFC_LIB_NO_LOCAL_REGION   (local region not present)
         # CCURPMFC_LIB_NO_RESOURCE       (no free PLL available)
         # CCURPMFC_LIB_IO_ERROR          (read error)

*****
```

2.2.18 ccurPMFC_ADC_Read_Channels()

This call provides the user an easy method of reading the ADC channels. User can supply a channel mask. If pointer to *adc_csr* is NULL, then the routine itself computes the current ADC configuration. For performance, the user should get the current ADC configuration using the *ccurPMFC_ADC_Get_CSR()* call to get the current settings and pass it to this routine. Hence, if the configuration is not changed, the user can continuously invoke *ccurPMFC_ADC_Read_Channels()* routine without incurring the additional overhead of routine calling the *ccurPMFC_ADC_Get_CSR()* call.

```

*****  

_ccurpmfc_lib_error_number_t  

ccurPMFC_ADC_Read_Channels(void  

                           _ccurpmfc_adc_channel_mask_t ChanMask,

*****

```

2.2.25 ccurPMFC_ADC_Set_Negative_Cal()

This call allows the user to set the negative calibration data for all the channels by supplying floating point *Float* gains to the call. Users can supply CCURPMFC_DO_NOT_CHANGE as a gain for any channel that should not be changed. Additionally, this call will return the *RAW* value of the gain supplied that is written to the board.

```

*****_ccurpmfc_lib_error_number_t
ccurPMFC_ADC_Set_Negative_Cal(void             *Handle,
                               ccurpmfc_adc_cal_t *cal)

Description: Set the ADC Negative Calibration data.

Input:    void                  *Handle      (handle pointer)
          ccurpmfc_adc_cal_t     *cal        (pointer to board cal)
          uint                   Raw[CCURPMFC_MAX_ADC_CHANNELS];
          double                 Float[CCURPMFC_MAX_ADC_CHANNELS];
Output:   none
Return:   _ccurpmfc_lib_error_number_t
          # CCURPMFC_LIB_NO_ERROR           (successful)
          # CCURPMFC_LIB_BAD_HANDLE        (no/bad handler supplied)

2.2.29 ccurPMFC_Add_Irq()

This call will add the driver interrupt handler if it has not been added. Normally, the user should not use this call unless they want to disable the interrupt handler and then re-enable it.

```
*****
int ccurPMFC_Add_Irq(void *Handle)

Description: By default, the driver assigns an interrupt handler to handle
device interrupts. If the interrupt handler was removed using
the ccurPMFC_Remove_Irq(), then this call adds it back.

Input: void *Handle                               (Handle pointer)
Output: none
Return: _ccurpmfc_lib_error_number_t
        # CCURPMFC_LIB_NO_ERROR                (successful)
        # CCURPMFC_LIB_BAD_HANDLE              (no/bad handler supplied)
        # CCURPMFC_LIB_NOT_OPEN               (library not open)
        # CCURPMFC_LIB_IOCTL_FAILED           (driver ioctl call failed)
*****

```

2.2.30 ccurPMFC_BoardExpirationTimeRemaining()

This call provides useful information about the expiration date of the card if it has restricted licensing.

```
*****
_ccurpmfc_lib_error_number_t
ccurPMFC_BoardExpirationTimeRemaining(void
                                      *Handle,
                                      time_t
                                      *SecondsToExpire,
                                      ccurpmfc_date_string_t *GmtDateTimeString,
                                      ccurpmfc_date_string_t *LocalDateTimeString,
                                      _ccurpmfc_firmware_state *FirmwareState)

Description: Number of seconds to expire on a restricted card

Input: void                                     *Handle          (Handle pointer)
Output: time_t                                  *SecondsToExpire (seconds to expire)
        ccurpmfc_date_string_t      *GmtDateTimeString (GMT date/time
                                                string)
        char date[CCURPMFC_DATE_TIME_STRING_SIZE]
        ccurpmfc_date_string_t      *LocalDateTimeString (Local date/time
                                                string)
        char date[CCURPMFC_DATE_TIME_STRING_SIZE]
        _ccurpmfc_firmware_state   *FirmwareState       (Firmware State)
        # CCURPMFC_FIRMWARE_STATE_UNRESTRICTED
        # CCURPMFC_FIRMWARE_STATE_RESTRICTED
        # CCURPMFC_FIRMWARE_STATE_EXPIRED
Return: _ccurpmfc_lib_error_number_t
        # CCURPMFC_LIB_NO_ERROR                (successful)
        # CCURPMFC_LIB_BAD_HANDLE              (no/bad handler supplied)
        # CCURPMFC_LIB_NOT_OPEN               (library not open)
*****

```

Mandatory arguments to the call are **Handle* and **SecondsToExpire*. Rest of the arguments are optional and be set to *NULL*.

SecondsToExpire* – If the board has an expiration date, this call will return the number of seconds this card can be used before it expires. *Once the card has expired, this call will not be reached as the device open will fail with an authorization error.***

If the board has no expiration date, this call will return zero as the number of seconds.

*GmtDateString – If the board has an expiration date, this ascii GMT date representation of the expiration date is available in this variable if it is not NULL

*LocalDateString – If the board has an expiration date, this ascii Local date representation of the expiration date is available in this variable if it is not NULL

*FirmwareState – This returns the current state of the installed firmware. I can be one of:

- CCURPMFC_FIRMWARE_STATE_UNRESTRICTED. This firmware has no restrictions.
- CCURPMFC_FIRMWARE_STATE_RESTRICTED. This firmware has restrictions. It is possible that an expiration date restriction is not present.
- CCURPMFC_FIRMWARE_STATE_EXPIRED. This firmware has restrictions. One of the restrictions is the expiration date which has expired. Typically, you may not see this state as the utility will fail during the open with an authentication error.

2.2.31 **ccurPMFC_Clear_Driver_Error()**

This call resets the last driver error that was maintained internally by the driver to *CCURPMFC_SUCCESS*.

```
*****
    _ccurpmfc_lib_error_number_t ccurPMFC_Clear_Driver_Error(void *Handle)

    Description: Clear any previously generated driver related error.

    Input:    void *Handle                      (Handle pointer)
    Output:   none
    Return:   _ccurpmfc_lib_error_number_t
              # CCURPMFC_LIB_NO_ERROR          (successful)
              # CCURPMFC_LIB_BAD_HANDLE        (no/bad handler supplied)
              # CCURPMFC_LIB_NOT_OPEN         (device not open)
              # CCURPMFC_LIB_IOCTL_FAILED     (driver ioctl call failed)
*****

```

2.2.32 **ccurPMFC_Clear_Lib_Error()**

This call resets the last library error that was maintained internally by the API.

```
*****
    _ccurpmfc_lib_error_number_t ccurPMFC_Clear_Lib_Error(void *Handle)

    Description: Clear any previously generated library related error.

    Input:    void *Handle                      (Handle pointer)
    Output:   none
    Return:   _ccurpmfc_lib_error_number_t
              # CCURPMFC_LIB_NO_ERROR          (successful)
              # CCURPMFC_LIB_BAD_HANDLE        (no/bad handler supplied)
              # CCURPMFC_LIB_NOT_OPEN         (device not open)
*****

```

2.2.33 **ccurPMFC_Clock_Generator_Soft_Reset()**

Perform a soft clock reset on all the output clocks.

```
*****
    _ccurpmfc_lib_error_number_t ccurPMFC_Clock_Generator_Soft_Reset(void *Handle)

    Description: Perform Soft Reset to Clock Generator

```

```

2.2.52 ccurPMFC_Clock_ReturnOutputFrequency()

This call does not return the actual programmed frequency but instead returns the expected output frequency that would be generated if the specified user input parameters are supplied.

```

/*****
long double
ccurPMFC_Clock_ReturnOutputFrequency(double InputClock,
                                      long double Mdiv_value,
                                      long double Ndiv_value,
                                      double Pdiv_value,
                                      double Rdiv_value)

Description: Return output frequency

Input:   double InputClock (input clock frequency in Hz)
        long double Mdiv_value (M-Divider value)
        long double Ndiv_value (N-Divider value)
        double Pdiv_value (P-Divider value)
        double Rdiv_value (R-Divider value)
Output:  none
Return:  long double returned frequency
*****

```

2.2.53 ccurPMFC_Clock_Set_Generator_CSR()

This call sets the clock generator control and status register.

```

/*****
_ccurpmfc_lib_error_number_t

2.2.70 ccurPMFC_Convert_Physmem2avmm_Address()

This call is used to supply the user with an Avalon equivalent Address for the supplied Physical DMA memory. This Avalon equivalent address can then be supplied to the DMA engine to perform DMA operations.

```

/*****
    _ccurpmfc_lib_error_number_t
    ccurPMFC_Convert_Physmem2avmm_Address(void *Handle,
                                              uint *PhysDmaMemPtr,
                                              uint *AvalonAddress)

Description: Get the converted value of Physical DMA memory to Avalon address
            to be supplied as address for DMA operations.

Input: void *Handle (Handle pointer)
       uint *PhysDmaMemPtr (pointer to physical DMA memory)
Output: uint *AvalonAddress (pointer to Avalon Address).

Return: _ccurpmfc_lib_error_number_t (successful)
        # CCURPMFC_LIB_NO_ERROR (no/bad handler supplied)
        # CCURPMFC_LIB_BAD_HANDLE (library not open)

2.2.71 ccurPMFC_Create_UserDioCosInterruptHandler()

This call provides the ability for a user to get notification when a DIO change-of-state interrupt occurs. Prior to invoking this call, the user needs to create an *interrupt callback* function which is supplied to this call as one of its inputs. Additionally, the user selects a set of DIO COS wakeup masks to enter the user supplied callback when a corresponding interrupt occurs. On successful completion of this call, a real-time high priority thread is created and blocked waiting for DIO COS interrupts. When a DIO COS interrupt occurs, the driver will wake up this thread which in turn will execute the user supplied *interrupt callback* function. Various DIO COS statistics will be returned to the user as an argument *driver_dio_cos_int* supplied to the *interrupt callback* routine everytime a wakeup occurs. The user needs to ensure that the processing within this *interrupt callback* should be completed in as short a time as possible for the thread to be ready in time to accept the next DIO COS interrupt. Failure to do so will result in missed change-of-state interrupts.

If the interrupt handler has already been created for a device, then the user will be unable to create another one as only one interrupt handler is assigned to each device. User will need to destroy the interrupt handler with the *ccurPMFC_Destroy_UserDioCosInterruptHandler()* call prior to creating a new one.

```

2.2.72 ccurPMFC_Create_UserProcess()

Typically reads from h/w take a finite time to complete. If the user has a process that is time critical and needs to read the latest data faster, they may use a new approach called Hyper-Drive. In this case, the user defines a thread with this call, which continuously reads the data from the board and holds the latest values. The user process can then access this latest data at substantially faster rates. The two drawbacks to this approach is that the excessive bus assess is made and dedicated CPUs are required.

This call is used to create this User Process looping thread which can be controlled by the user via the returned handle. (*This is an experimental API for debugging and testing*).

```
*****
_ccurpmfc_lib_error_number_t
ccurPMFC_Create_UserProcess(void
                            _ccurpmfc_UserFunction_t      *Handle,

        # CCURPMFC_LIB_NO_LOCAL_REGION   (local region not present)
        # CCURPMFC_LIB_IOCTL_FAILED      (driver ioctl call failed)
        # CCURPMFC_LIB_INVALID_ARG       (invalid argument)
*****

```

2.2.76 ccurPMFC_DAC_Get_Fifo_Channel_Select()

This call returns the current Fifo Channel selection mask. Only samples for these selected channels are placed in the FIFO during sample generation. Unlike the ADC Fifo channel select option, this DAC FIFO channel select option also restricts DAC channel register writes to those selected by this option. The advantage for implementing this option for DAC channel registers in addition to DAC FIFO is that the user can perform DMA operations to generate samples on selected channels without affecting the output of those channels that have not been included in the channel selection.

```
*****
    _ccurpmfc_lib_error_number_t
    ccurPMFC_DAC_Get_Fifo_Channel_Select(void           *Handle,
                                         _ccurpmfc_dac_channel_mask_t   *dac_fifo_channel_select_mask)

Description: DAC Get Fifo Channel Selection

Input:   void                                *Handle          (handle pointer)
Output:  _ccurpmfc_dac_channel_mask_t *dac_fifo_channel_select_mask
        (channel select mask)
        # CCURPMFC_DAC_CHANNEL_MASK_0

*****

```

2.2.86 **ccurPMFC_DAC_Read_Channels_Calibration()**

This routine reads the DAC channel calibration registers and dumps them to the user specified file. If the file name specified is NULL, then information is written to *stdout*.

```

/*****
            _ccurpmfc_lib_error_number_t
            ccurPMFC_DAC_Read_Channels_Calibration(void *Handle,
                                         char *filename)

Description: Read DAC Channels Calibration

Input:      void      *Handle           (handle pointer)
Output:     char      *filename         (pointer to filename)
Return:     _ccurpmfc_lib_error_number_t
            # CCURPMFC_LIB_NO_ERROR          (successful)
            # CCURPMFC_LIB_BAD_HANDLE        (no/bad handler supplied)
            # CCURPMFC_LIB_NOT_OPEN          (library not open)
            # CCURPMFC_LIB_NO_LOCAL_REGION   (local region not present)
            # CCURPMFC_LIB_CANNOT_OPEN_FILE  (cannot open calib. file)
            # CCURPMFC_LIB_DAC_IS_NOT_ACTIVE (ADC is not active)
*****

```

2.2.87 **ccurPMFC_DAC_ReadBack_Channels()**

This call is more of debug purpose. It causes the DAC channels output to be connected to a user specified ADC channel and then returns the current reading of the ADC channel. Hence, we have read back the DAC channels selected.

All information contained in this document is confidential and proprietary to Concurrent Real-Time. No part of this document may be reproduced, transmitted, in any form, without the prior written permission of Concurrent Real-Time. No license, expressed or implied, under any patent, copyright or trade secret right is granted or implied by the conveyance of this document.

If the ADC configuration *adc_csr* is *NULL*, then the call reads the current ADC configuration for the selected ADC channel *ADCChan*, however, the user can instead supply a pointer to the ADC configuration *adc_csr* where they have already configured the ADC as the following:

```
adc_data_format = CCURPMFC_ADC_TWOS_COMPLEMENT
adc_input_range = CCURPMFC_ADC_BIPOLAR_10V
adc_input_signal = CCURPMFC_ADC_CALIBRATION_BUS
adc_update_clock = CCURPMFC_ADC_UPDATE_CLOCK_0
```

Note that the *adc_update_clock* should be set to the currently active clock. Failure to set the above values will result in the call failing with invalid argument *CCURPMFC_LIB_INVALID_ARG*.

```

```

2.2.88 ccurPMFC_DAC_Read_Channels()

This call provides the user an easy method of reading the DAC channels. User can supply a channel mask. If pointer to *dac_csr* is NULL, then the routine itself computes the current DAC configuration. For performance, the user should get the current DAC configuration using the *ccurPMFC_DAC_CSR()* call to get the current settings and pass it to this routine. Hence, if the configuration is not changed, the user can continuously invoke *ccurPMFC_DAC_Read_Channels()* routine without incurring the additional overhead of routine calling the *ccurPMFC_DAC_CSR()* call.

```

*****
_ccurpmfc_lib_error_number_t
ccurPMFC_DAC_Read_Channels(void *Handle,
                           _ccurpmfc_dac_channel_mask_t ChanMask,

*****

```

2.2.92 ccurPMFC_DAC_Set_Fifo_Channel_Select()

This call allows the user to select a set of channels that need to be provided in the DAC FIFO or the DAC channel registers. Only samples for these selected channels are placed in the FIFO during sample generation. Unlike the ADC Fifo channel select option, this DAC FIFO channel select option also restricts DAC channel register writes to those selected by this option. The advantage for implementing this option for DAC channel registers in addition to DAC FIFO is that the user can perform DMA operations to generate samples on selected channels without affecting the output of those channels that have not been included in the channel selection.

```

/*****
_ccurpmfc_lib_error_number_t
ccurPMFC_DAC_Set_Fifo_Channel_Select(void          *Handle,
                                         _ccurpmfc_dac_channel_mask_t
                                         dac_fifo_channel_select_mask)

Description: DAC Set Fifo Channel Selection

Input:    void                      *Handle                  (handle pointer)
          _ccurpmfc_dac_channel_mask_t

        # CCURPMFC_LIB_DAC_IS_BUSY      (DAC is busy)
*****

```

2.2.99 ccurPMFC_DAC_Wait_For_Fifo_To_Drain()

This call is used prior to writing to the DAC fifo to ensure that there is enough sample space available to complete the write without getting an overflow condition. User needs to specify the threshold level to wait for the FIFO to reach, before returning to the caller. Note that if the threshold is too low, it is possible that the FIFO could experience an underflow condition prior to adding more samples to the FIFO.

```

/****************************************
_ccurpmfc_lib_error_number_t
ccurPMFC_DAC_Wait_For_Fifo_To_Drain (void    *Handle,
                                      uint     fifo_threshold)

Description: Wait for DAC Fifo to drain

Input:   void                  *Handle      (Handle pointer)
         uint                 fifo_threshold (fifo threshold)
Output:  none
Return:  _ccurpmfc_lib_error_number_t

        # CCURPMFC_LIB_NOT_OPEN         (device not open)
        # CCURPMFC_LIB_IOCTL_FAILED     (driver ioctl call
failed)
        # CCURPMFC_LIB_INVALID_ARG      (Invalid argument)
        # CCURPMFC_LIB_DAC_FIFO_UNDERFLOW (DAC Fifo underflow)
*****

```

2.2.100 ccurPMFC_DAC_Write_Channels()

This call provides the user an easy method of writing the DAC channels. User can supply a channel mask. If pointer to *dac_csr* is NULL, then the routine itself computes the current DAC configuration. For performance, the user should get the current DAC configuration using the *ccurPMFC_DAC_CSR()* call to get the current settings and pass it to this routine. Hence, if the configuration is not changed, the user can continuously invoke *ccurPMFC_DAC_Write_Channels()* routine without incurring the additional overhead of routine calling the *ccurPMFC_DAC_CSR()* call.

```

/****************************************
_ccurpmfc_lib_error_number_t
ccurPMFC_DAC_Write_Channels(void
                             *Handle,

```

```

2.2.107 ccurPMFC_DIO_Get_Channels_Polarity()

This call allows the user to get the polarity for the DIO channels. The *ChannelSelectMask* is used to retrieve polarity settings for selected channels.

For input channels, a value of *CCURPMFC_DIO_INPUT_LOW_TRUE* or ‘0’ for polarity indicates low true, while a value of *CCURPMFC_DIO_INPUT_HIGH_TRUE* or ‘1’ for polarity indicates high true.

For output channels, a value of *CCURPMFC_DIO_OUTPUT_LOW* or ‘0’ for polarity indicates low or 0 volts, while a value of *CCURPMFC_DIO_OUTPUT_HIGH* or ‘1’ for polarity indicates high or +5 volts.

```

2.2.108 ccurPMFC_DIO_Get_COS_Channels_Edge_Sense()

This call returns to the user the settings for the change-of-state to sense the rising or falling edge of the signal on input for all the channels. The *ChannelSelectMask* is used to retrieve edge sense settings for selected channels. A value of *CCURPMFC_DIO_COS_FALLING_EDGE* or ‘0’ represents sensing of falling edge of input signal while a value of *CCURPMFC_DIO_COS_RISING_EDGE* or ‘1’ represents sensing of rising edge of input signal.

```
/*

2.2.111 ccurPMFC_DIO_Get_COS_Channels_Overflow()

This call returns to the user the state of the change-of-state overflow registers for all the channels. The *ChannelSelectMask* is used to retrieve overflow settings for selected channels. A value of *CCURPMFC_DIO_COS_OVERFLOW_DID_NOT_OCCUR* or ‘0’ indicates that no overflow occurred while a value of *CCURPMFC_DIO_COS_OVERFLOW_OCCURRED* or ‘1’ indicates that an overflow condition occurred for the selected channels. An overflow condition is set when a change-of-state condition is detected on a channel that previously detected a change-of-state condition without its status being cleared.

2.2.112 ccurPMFC_DIO_Get_COS_Channels_Status()

This call returns to the user the state of the change-of-state status registers for all the channels. The *ChannelSelectMask* is used to retrieve status settings for selected channels. A value of *CCURPMFC_DIO_COS_DID_NOT_OCCUR* or ‘0’ indicates that no change-of-state occurred while a value of *CCURPMFC_DIO_COS_OCCURRED* or ‘1’ indicates that a change-of-state condition occurred for the selected channels. A change-of-state status is set when the hardware is enabled to detect a change of input signal transition and an input signal is received with the monitored transition.

```

2.2.113 ccurPMFC_DIO_Get_Input_Channels_Filter()

This call allows the user to get the settings for the DIO channels input filters. The *ChannelSelectMask* is used to retrieve filter settings for selected channels. A value of *CCURPMFC_DIO_INPUT_FILTER_ENABLED* or '0' for filter indicates that the 100 nanosecond filter is enabled for the selected channel, while a value of *CCURPMFC_DIO_INPUT_FILTER_DISABLED* or '1' indicates that the filter is disabled. On powerup, filter for all channels are enabled.

```

    /* # CCURPMFC_LIB_DIO_IS_NOT_ACTIVE (DIO is not active) */
}

```

2.2.117 ccurPMFC_DIO_Get_Ports_Direction()

This call allows the user to get the direction of the digital channels. There are 24 ports with grouping of 4 channels per port. Direction control is on a port level or a group of 4 channels.

When the direction for channels are set to output, then reading the channels input registers will result in acquiring what was written to the output (loopback). When the direction for the channels are set as inputs, then reading the channels input registers will result in acquiring signals coming into the board from the external digital lines.

```

/********************* _ccurpmfc_lib_error_number_t *****/

*****

```

2.2.118 ccurPMFC_DIO_Read_Custom_Channel_Registers()

This call allows the user to display any DIO channels that have been reserved for custom usage. This is specifically dependant of the firmware being loaded. The user must enable the custom mode for DIO operation before reviewing these reserved channels. If no channels are listed, then no custom DIO channels exist. Any custom DIO channel will not operate in the normal DIO functionality but will behave differently based on the firmware loaded.

```

```

2.2.119 ccurPMFC_DIO_Read_Input_Channel_Registers()

This call reads the contents of the input channel registers and returns to the user. There are two modes of operation for this call. (1) Continuous (2) Snapshot.

When the user selects the *continuous* operation, this call immediately returns to the user whatever is available on the input registers as they are being received by the hardware. There is therefore no synchronizing occurring between the three input channel registers (32 channels/register). For performance improvements with this operational mode, it is recommended that the user sets the continuous option using the *ccurPMFC_DIO_Set_Input_Snapshot()* call once and then supply

All information contained in this document is confidential and proprietary to Concurrent Real-Time. No part of this document may be reproduced, transmitted, in any form, without the prior written permission of Concurrent Real-Time. No license, expressed or implied, under any patent, copyright or trade secret right is granted or implied by the conveyance of this document.

CCURPMFC_DIO_INPUT_OPERATION_DO_NOT_CHANGE to this call for more reads. In this way, an additional register access will not occur everytime this call is issued.

When the user selects the *snapshot* operation, there is no need to issue the *ccurPMFC_DIO_Set_Input_Snapshot()*. All that is required is to supply the *CCURPMFC_DIO_INPUT_OPERATION_SNAPSHOT* option when issuing this call. The result is that all the three input registers will be captured instantaneously (in sync) by the firmware and returned to the user.

Obviously, the *snapshot* option is only meaningful if the user selects channels (*using the channel selection mask*) that reside in at least two different input channel registers.

```
Input channel register 0: Channels 0 to 31
Input channel register 1: Channels 32 to 63
Input channel register 2: Channels 64 to 95
```

The *skip_dio_disable_check* (when set to *CCURPMFC_FALSE*) causes the call to test for DIO being enabled prior to proceeding. If this option is set to *CCURPMFC_TRUE*, then no test is. If the DIO has not been enabled, input reads will be invalid. The only reason for providing the option to disable the check is to improve the performance of the call. If the user can ensure that the DIO is enabled prior to issuing this call, they can set this option to *CCURPMFC_TRUE* so that no test is performed and hence, improve performance.

When the direction for channels are set to output, then reading the channels input registers will result in acquiring what was written to the output (loopback). When the direction for the channels are set as inputs, then reading the channels input registers will result in acquiring signals coming into the board from the external digital lines.

2.2.121 ccurPMFC_DIO_Set_Channels_Polarity()

This call allows the user to set the polarity for the DIO channels. The *ChannelSelectMask* is used to retrieve polarity settings for selected channels.

For input channels, a value of *CCURPMFC_DIO_INPUT_LOW_TRUE* or '0' for polarity indicates low true, while a value of *CCURPMFC_DIO_INPUT_HIGH_TRUE* or '1' for polarity indicates high true.

For output channels, a value of *CCURPMFC_DIO_OUTPUT_LOW* or '0' for polarity indicates low or 0 volts, while a value of *CCURPMFC_DIO_OUTPUT_HIGH* or '1' for polarity indicates high or +5 volts.

```

2.2.122 *ccurPMFC_DIO_Set_COS_Channels_Edge_Sense()*

This call sets the change-of-state to sense the rising or falling edge of the signal on input for the channels. The *ChannelSelectMask* is used to set the edge sense settings for selected channels. A value of *CCURPMFC_DIO_COS_FALLING_EDGE* or ‘0’ represents sensing of falling edge of input signal while a value of *CCURPMFC_DIO_COS_RISING_EDGE* or ‘1’ represents sensing of rising edge of input signal.

For edge sensing to occur, the *CCURPMFC_DIO_COS_RISING_OR_FALLING_TRANSITION* bit needs to be set for the corresponding channels using the *ccurPMFC_DIO_Set_COS_Channels_Mode()* call.

```

2.2.123 ccurPMFC_DIO_Set_COS_Channels_Enable()

If the user wishes to monitor change-of-state for a channel, then need to enable the change-of-state detection for the respective channels using this call. Without the channel being enabled, no change-of-state detection will occur. The *ChannelSelectMask* is used to set enable settings for selected channels. A value of *CCURPMFC_DIO_COS_IGNORE* or ‘0’ ignores change-of-state while a value of *CCURPMFC_DIO_COS_ENABLE* or ‘1’ represents enabling change-of-state for the selected channels.

```

2.2.124 ccurPMFC_DIO_Set_COS_Channels_Mode()

This call sets the change-of-state mode registers all the channels. The *ChannelSelectMask* is used to set the mode settings for selected channels. A value of *CCURPMFC_DIO_COS_ANY_TRANSITION* or ‘0’ sets change-of-state on any edge transition while a value of *CCURPMFC_DIO_COS_RISING_OR_FALLING_TRANSITION* or ‘1’ represents enabling change-of-state for either rising edge or falling edge depending on the channel edge sense setting for the selected channels.

2.2.125 ccurPMFC_DIO_Set_Input_Channels_Filter()

This call allows the user to set or reset filters for a selected set of input channels. The *ChannelSelectMask* is used to select channels for filter settings. A value of *CCURPMFC_DIO_INPUT_FILTER_ENABLED* or '0' for filter indicates that the 100 nanosecond filter is enabled for the selected channel, while a value of *CCURPMFC_DIO_INPUT_FILTER_DISABLED* or '1' indicates that the filter is disabled. On powerup, filter for all channels are enabled.

```

```

2.2.126 ccurPMFC_DIO_Set_Input_Snapshot()

This call allows the user to set the board in snapshot mode where all three input registers are acquired simultaneously (in sync) by the hardware and presented to the user. Mainly, this particular call is only useful for setting the operation to continuous mode. There is no need to set to snapshot mode as the read input registers call *ccurPMFC_DIO_Read_Input_Channel_Registers()* an option to set it call.

If the user wants to collect data in the continuous mode, then they should issue this call once with the *CCURPMFC_DIO_INPUT_OPERATION_CONTINUOUS* option and then call the read of the input channels with the *CCURPMFC_DO_NOT_CHANGE* option. In this way, there is no un-necessary overhead in setting the board into continuous mode once it has already been set.

Recommended procedure for continuous mode is to issue this call only once with the *CCURPMFC_DIO_INPUT_OPERATION_CONTINUOUS* option and then followup with continuous input channel reads using the *ccurPMFC_DIO_Read_Input_Channel_Register()* call with the *CCURPMFC_DIO_INPUT_OPERATION_DO_NOT_CHANGE* option for *dio_snapshot*.

Recommended procedure for snapshot mode is to issue continuous input channel reads using the *ccurPMFC_DIO_Read_Input_Channel_Register()* call with the *CCURPMFC_DIO_INPUT_OPERATION_SYNC* option for *dio_snapshot*. There is really no need to issue this call.

```

*****
_ccurpmfc_lib_error_number_t
ccurPMFC_DIO_Set_Input_Snapshot(void                                *Handle,
                                  _ccurpmfc_dio_input_snapshot_t dio_snapshot)

Description: Set DIO Input Snapshot

Input:   void                                *Handle                  (handle pointer)
Output:  _ccurpmfc_dio_input_snapshot_t dio_snapshot                (dio snapshot)
        # CCURPMFC_DIO_INPUT_OPERATION_CONTINUOUS
        # CCURPMFC_DIO_INPUT_OPERATION_SNAPSHOT
Return: _ccurpmfc_lib_error_number_t
        # CCURPMFC_LIB_NO_ERROR           (successful)
        # CCURPMFC_LIB_BAD_HANDLE        (no/bad handler supplied)

```

All information contained in this document is confidential and proprietary to Concurrent Real-Time. # CCURPMFC_LIB_NOT_OPEN          (device not open)
# CCURPMFC_LIB_INVALID_ARG      (invalid argument)
# CCURPMFC_LIB_NO_LOCAL_REGION   (local region not present)
# CCURPMFC_LIB_DIO_IS_NOT_ACTIVE (DIO is not active)
*****

```

2.2.127 ccurPMFC_DIO_Set_Mode()

This call allows the user to select a custom or a normal mode of DIO operation. In the normal mode, all 96 channels are available for DIO operation, while, in the custom mode, the custom channels supplied in the custom input registers may not operate as normal DIO channels. These custom channels behavior will depend entirely on the firmware loaded into the board.

```

/*****
    _ccurpmfc_lib_error_number_t
    ccurPMFC_DIO_Set_Mode(void           *Handle,
                          _ccurpmfc_dio_mode_t dio_mode)

Description: Set DIO Mode

Input:   void                  *Handle          (handle pointer)
Output:  _ccurpmfc_dio_mode_t    dio_mode        (dio mode)
         # CCURPMFC_DIO_MODE_CUSTOM
         # CCURPMFC_DIO_MODE_NORMAL
Return:  _ccurpmfc_lib_error_number_t
         # CCURPMFC_LIB_NO_ERROR          (successful)
         # CCURPMFC_LIB_BAD_HANDLE       (no/bad handler supplied)
         # CCURPMFC_LIB_NOT_OPEN         (device not open)
         # CCURPMFC_LIB_INVALID_ARG      (invalid argument)
         # CCURPMFC_LIB_NO_LOCAL_REGION   (local region not present)
         # CCURPMFC_LIB_DIO_IS_NOT_ACTIVE (DIO is not active)
*****

```

2.2.128 ccurPMFC_DIO_Set_Output_Sync()

This call allows the user to set the digital output channels to either *continuous* mode or *sync* mode. When the board is in continuous mode, any update to one of the three output registers will be immediately sent to the output lines. There will be no synchronization between the three output registers. When the sync mode is selected, no output is sent while updating the output registers. Once the output sync flag is set, the contents of all three output registers will be sent simultaneously to the output lines.

Recommended procedure for continuous mode is to issue this call only once with the *CCURPMFC_DIO_OUTPUT_OPERATION_CONTINUOUS* option and then followup with continuous output channel writes using the *ccurPMFC_DIO_Write_Output_Channel_Register()* call with the *CCURPMFC_DIO_INPUT_OPERATION_DO_NOT_CHANGE* option for *dio_sync*.

Recommended procedure for sync mode is to issue this call only once with the *CCURPMFC_DIO_OUTPUT_OPERATION_SYNC* option and then followed up with continuous output channel writes using the *ccurPMFC_DIO_Write_Output_Channel_Register()* call with the *CCURPMFC_DIO_OUTPUT_OPERATION_SYNC* option for *dio_sync*.

```

/*****
    _ccurpmfc_lib_error_number_t
    ccurPMFC_DIO_Set_Output_Sync(void           *Handle,
                                 _ccurpmfc_dio_output_sync_t dio_sync)

Description: Set DIO Output Sync

Input:   void                  *Handle          (handle pointer)
         _ccurpmfc_dio_output_sync_t    dio_sync        (dio sync)
         # CCURPMFC_DIO_OUTPUT_OPERATION_CONTINUOUS

```

```

        # CCURPMFC_DIO_OUTPUT_OPERATION_SYNC
Output: none
Return: _ccurpmfc_lib_error_number_t
        # CCURPMFC_LIB_NO_ERROR          (successful)
        # CCURPMFC_LIB_BAD_HANDLE       (no/bad handler supplied)
        # CCURPMFC_LIB_NOT_OPEN         (device not open)
        # CCURPMFC_LIB_INVALID_ARG      (invalid argument)
        # CCURPMFC_LIB_NO_LOCAL_REGION   (local region not present)
        # CCURPMFC_LIB_DIO_IS_NOT_ACTIVE (DIO is not active)
*****

```

2.2.129 ccurPMFC_DIO_Set_Ports_Direction()

This call allows the user to set the direction of the digital channels. There are 24 ports with grouping of 4 channels per port. Direction control is on a port level or a group of 4 channels.

When the direction for channels are set to output, then reading the channels input registers will result in acquiring what was written to the output (readback). When the direction for the channels are set as inputs, then reading the channels input registers will result in acquiring signals coming into the board from the external digital lines.

```

/*****
*ccurpmfc_lib_error_number_t
ccurPMFC_DIO_Set_Ports_Direction(void *Handle, _ccurpmfc_dio_port_mask_t dio_direction)

Description: Set DIO Port Direction Mask

2.2.130 ccurPMFC_DIO_Set_Ports_Direction_To_Input()

This call allows the user to set the direction of a selected set of digital channels to Inputs. Other channels are unchanged. There are 24 ports with grouping of 4 channels per port. Direction Input control is on a port level or a group of 4 channels.

When the direction for the channels are set as inputs, then reading the channels input registers will result in acquiring signals coming into the board from the external digital lines.

2.2.132 ccurPMFC_DIO_Write_Output_Channel_Registers()

This call writes the user supplied channel settings to the output channel registers. There are two modes of operation for this call. (1) Continuous (2) Sync.

When the user selects the *continuous* operation, this call immediately sends out the channel data to the output lines as they are written to the output registers. There is therefore no synchronizing occurring between the three output channel registers (32 channels/register). For performance improvements with this operational mode, it is recommended that the user sets the continuous option using the *ccurPMFC_DIO_Set_Output_Sync()* call once and then supply *CCURPMFC_DIO_INPUT_OPERATION_DO_NOT_CHANGE* to this call for more writes. In this way, an additional register access will not occur everytime this call is issued.

When the user selects the *sync* operation, they need to issue the *ccurPMFC_DIO_Set_Output_Sync()* call once with the *CCURPMFC_DIO_OUTPUT_OPERATION_SYNC* option, followed by issuing this call with the *CCURPMFC_DIO_OUTPUT_OPERATION_SYNC* option in *dio_sync*.

Obviously, the *sync* option is only meaningful if the user selects channels (*using the channel selection mask*) that reside in at least two different output channel registers.

Output channel register 0: Channels 0 to 31
 Output channel register 1: Channels 32 to 63
 Output channel register 2: Channels 64 to 95

The *skip_dio_disable_check* (when set to *CCURPMFC_FALSE*) causes the call to test for DIO being enabled prior to proceeding. If this option is set to *CCURPMFC_TRUE*, then no test is. If the DIO has not been enabled, output writes will not take place. The only reason for providing the option to disable the check is to improve the performance of the call. If the user can ensure that the DIO is enabled prior to issuing this call, they can set this option to *CCURPMFC_TRUE* so that no test is performed and hence, improve performance.

2.2.133 ccurPMFC_DIO_Write_Output_Channel_High_Registers()

This call writes a selected set of channels to high outputs. Rest of the channels is not affected. There are two modes of operation for this call. (1) Continuous (2) Sync.

When the user selects the *continuous* operation, this call immediately sends out the channel high data to the output lines as they are written to the output registers. There is therefore no synchronizing occurring between the three output channel registers (32 channels/register). For performance improvements with this operational mode, it is recommended that the user sets the continuous option using the *ccurPMFC_DIO_Set_Output_Sync()* call once and then supply *CCURPMFC_DIO_INPUT_OPERATION_DO_NOT_CHANGE* to this call for more writes. In this way, an additional register access will not occur everytime this call is issued.

When the user selects the *sync* operation, they need to issue the *ccurPMFC_DIO_Set_Output_Sync()* call once with the *CCURPMFC_DIO_OUTPUT_OPERATION_SYNC* option, followed by issuing this call with the *CCURPMFC_DIO_OUTPUT_OPERATION_SYNC* option in *dio_sync*.

Obviously, the *sync* option is only meaningful if the user selects channels (*sets channels for high*) that reside in at least two different output channel registers.

Output channel register 0: Channels 0 to 31

Output channel register 1: Channels 32 to 63

Output channel register 2: Channels 64 to 95

The *skip_dio_disable_check* (when set to *CCURPMFC_FALSE*) causes the call to test for DIO being enabled prior to proceeding. If this option is set to *CCURPMFC_TRUE*, then no test is. If the DIO has not been enabled, output writes will not take place. The only reason for providing the option to disable the check is to improve the performance of the call. If the user can ensure that the DIO is enabled prior to issuing this call, they can set this option to *CCURPMFC_TRUE* so that no test is performed and hence, improve performance.

2.2.134 `ccurPMFC_DIO_Write_Output_Channel_Low_Registers()`

This call writes a selected set of channels to low outputs. Rest of the channels is not affected. There are two modes of operation for this call. (1) Continuous (2) Sync.

When the user selects the *continuous* operation, this call immediately sends out the channel low data to the output lines as they are written to the output registers. There is therefore no synchronizing occurring between the three output channel registers (32 channels/register). For performance improvements with this operational mode, it is recommended that the user sets the continuous option using the `ccurPMFC_DIO_Set_Output_Sync()` call once and then supply `CCURPMFC_DIO_INPUT_OPERATION_DO_NOT_CHANGE` to this call for more writes. In this way, an additional register access will not occur everytime this call is issued.

When the user selects the *sync* operation, they need to issue the `ccurPMFC_DIO_Set_Output_Sync()` call once with the `CCURPMFC_DIO_OUTPUT_OPERATION_SYNC` option, followed by issuing this call with the `CCURPMFC_DIO_OUTPUT_OPERATION_SYNC` option in `dio_sync`.

Obviously, the *sync* option is only meaningful if the user selects channels (*sets channels for low*) that reside in at least two different output channel registers.

Output channel register 0: Channels 0 to 31
 Output channel register 1: Channels 32 to 63
 Output channel register 2: Channels 64 to 95

The *skip_dio_disable_check* (when set to *CCURPMFC_FALSE*) causes the call to test for DIO being enabled prior to proceeding. If this option is set to *CCURPMFC_TRUE*, then no test is. If the DIO has not been enabled, output writes will not take place. The only reason for providing the option to disable the check is to improve the performance of the call. If the user can ensure that the DIO is enabled prior to issuing this call, they can set this option to *CCURPMFC_TRUE* so that no test is performed and hence, improve performance.

```

2.2.135 ccurPMFC_Disable_Pci Interrupts()

The purpose of this call is to disable PCI interrupts. This call shouldn't be used during normal reads as calls could time out. The driver handles enabling and disabling interrupts during its normal course of operation.

```

/*****
    _ccurpmfc_lib_error_number_t
    ccurPMFC_Disable_Pci Interrupts(void *Handle,
                                    uint interrupt_mask))

Description: Disable interrupts being generated by the board.

Input: void             *Handle           (Handle pointer)
       uint            interrupt_mask (interrupt mask)
Output: none
Return: _ccurpmfc_lib_error_number_t
        # CCURPMFC_LIB_NO_ERROR          (successful)
        # CCURPMFC_LIB_BAD_HANDLE       (no/bad handler supplied)
        # CCURPMFC_LIB_NOT_OPEN         (device not open)
        # CCURPMFC_LIB_IOCTL_FAILED     (driver ioctl call failed)
*****

```

2.2.136 ccurPMFC_DMA_Configure()

The purpose of this call is configure a DMA engine to be ready for commencing DMA.

```

/*****
    _ccurpmfc_lib_error_number_t
    ccurPMFC_DMA_Configure(void
                           ccurpmfc_dma_engine_t *Handle,
                           DMAEngineNo,
                           AvMM_FromAddr,
                           AvMM_ToAddr,
                           DMASize)

Description: Configure DMA Engine

Input: void             *Handle           (Handle pointer)
       ccurpmfc_dma_engine_t DMAEngineNo (select DMA engine)
       # CCURPMFC_DMA0
       # CCURPMFC_DMA1
       uint            AvMM_FromAddr (Avalon Memory Converted Source Address)
       uint            AvMM_ToAddr  (Avalon Memory Converted Destination Address)
       uint            DMASize       (DMA transfer size in bytes)
Output: none
Return: _ccurpmfc_lib_error_number_t
        # CCURPMFC_LIB_NO_ERROR          (successful)
        # CCURPMFC_LIB_BAD_HANDLE       (no/bad handler supplied)
        # CCURPMFC_LIB_NOT_OPEN         (library not open)

2.2.137 ccurPMFC_DMA_Fire()

The purpose of this call is to initiate an already configured DMA engine.

```
*****
_ccurpmfc_lib_error_number_t
ccurPMFC_DMA_Fire(void *Handle,
                    DMAEngineNo,
                    UseInterrupts,
                    WaitForCompletion,
                    DmaControl)

Description: Start DMA Engine

Input:    void             *Handle           (Handle pointer)
          ccurpmfc_dma_engine_t DMAEngineNo   (select DMA engine)
          # CCURPMFC_DMA0
          # CCURPMFC_DMA1
          ccurpmfc_bool        UseInterrupts   (Enable Interrupt flag)
          # CCURPMFC_TRUE
          # CCURPMFC_FALSE
          ccurpmfc_bool        WaitForCompletion (Wait for Completion Flag)
          # CCURPMFC_TRUE
          # CCURPMFC_FALSE
          int                 DmaControl      (DMA control flags)
          # CCURPMFC_DMA_CONTROL_RCON (read constant)
          # CCURPMFC_DMA_CONTROL_WCON (write constant)
          # CCURPMFC_DMA_CONTROL_INCREMENT (increment)

Output:   none

Return:   _ccurpmfc_lib_error_number_t
          # CCURPMFC_LIB_NO_ERROR   (no error)
          # CCURPMFC_LIB_BAD_HANDLE (no/bad handler supplied)
          # CCURPMFC_LIB_NOT_OPEN   (library not open)
          # CCURPMFC_LIB_INVALID_ARG (invalid argument)
          # CCURPMFC_LIB_IOCTL_FAILED (ioctl failed)
          # CCURPMFC_LIB_DMA_FAILED (DMA failed)
*****
```

2.2.138 ccurPMFC_Enable_Pci_Interrupts()

The purpose of this call is to enable PCI interrupts. This call shouldn't be used during normal reads as calls could time out. The driver handles enabling and disabling interrupts during its normal course of operation.

```
*****
_ccurpmfc_lib_error_number_t
ccurPMFC_Enable_Pci_Interrupts (void *Handle,
                                 uint interrupt_mask)

Description: Enable interrupts being generated by the board.

Input:    void             *Handle           (Handle pointer)
          uint             interrupt_mask   (interrupt mask)

Output:   none

Return:   _ccurpmfc_lib_error_number_t
          # CCURPMFC_LIB_NO_ERROR   (successful)
          # CCURPMFC_LIB_BAD_HANDLE (no/bad handler supplied)
          # CCURPMFC_LIB_NOT_OPEN   (device not open)
          # CCURPMFC_LIB_IOCTL_FAILED (driver ioctl call failed)
*****
```

2.2.139 ccurPMFC_Fast_Memcpy()

The purpose of this call is to provide a fast mechanism to copy between hardware and memory using programmed I/O. The library performs appropriate locking while the copying is taking place.

```
*****
ccurPMFC_Fast_Memcpy(void          *Handle,
                      volatile void *Destination,
                      volatile void *Source,
                      int           SizeInBytes)

Description: Perform fast copy to/from buffer using Programmed I/O
(WITH LOCKING)

Input:   void          *Handle          (Handle pointer)
         volatile void *Source        (pointer to source buffer)
         int           SizeInBytes   (transfer size in bytes)
Output:  volatile void *Destination    (pointer to destination buffer)
Return:  _ccurpmfc_lib_error_number_t
         # CCURPMFC_LIB_NO_ERROR (successful)
         # CCURPMFC_LIB_BAD_HANDLE (no/bad handler supplied)
         # CCURPMFC_LIB_NOT_OPEN  (device not open)
*****

```

2.2.140 ccurPMFC_Fast_Memcpy_Unlocked()

The purpose of this call is to provide a fast mechanism to copy between hardware and memory using programmed I/O. The library does not perform any locking. User needs to provide external locking instead.

```
*****
void
ccurPMFC_Fast_Memcpy_Unlocked(volatile void *Destination,
                               volatile void *Source,
                               int           SizeInBytes
                               int           DoubleWordSupport)

Description: Perform fast copy to/from buffer using Programmed I/O
(WITHOUT LOCKING)

Input:   volatile void *Source        (pointer to source buffer)
         int           SizeInBytes   (transfer size in bytes)
         int           DoubleWordSupport (double word support flag)
Output:  volatile void *Destination  (pointer to destination buffer)
Return:  none
*****

```

2.2.141 ccurPMFC_Fast_Memcpy_Unlocked_FIFO()

The purpose of this call is to provide a simple mechanism to copy between hardware FIFO and memory using programmed I/O. The library does not perform any locking. User needs to provide external locking instead.

```
*****
void
ccurPMFC_Fast_Memcpy_Unlocked_FIFO(volatile void *Destination,
                                      volatile void *Source,
                                      int           SizeInWords,
                                      int           PioControl,
                                      int           DoubleWordSupport)

Description: Perform fast copy to/from FIFO buffer using Programmed I/O
(WITHOUT LOCKING)

Input:   volatile void *Source        (pointer to source buffer)

```

        # CCURPMFC_PIO_CONTROL_WCON   (write constant)
        # CCURPMFC_PIO_CONTROL_INCREMENT (read/write increment)
    Output: volatile void *Destination      (pointer to destination buffer)
    Return: none
*****

```

2.2.142 ccurPMFC_Fraction_To_Hex()

This converts a fractional decimal to a hexadecimal value.

```

/*****
    int
    ccurPMFC_Fraction_To_Hex (double Fraction,
                               uint     *value)

    Description: Convert Fractional Decimal to Hexadecimal

    Input:      double   Fraction      (fraction to convert)
    Output:     uint     *value;       (converted hexadecimal value)
    Return:     1                  (call failed)
                0                  (good return)
*****

```

2.2.143 ccurPMFC_Get_All_Boards_Driver_Info()

This call returns driver information for all the *ccurpmfc* cards that have been found in the system.

```

/*****
    _ccurpmfc_lib_error_number_t
    ccurPMFC_Get_All_Boards_Driver_Info(void                      *Handle,
                                         ccurpmfc_all_boards_driver_info *all_boards_info)

    Description: Get device information from driver for all boards.

    Input:      void           *Handle          (Handle pointer)
    Output:     ccurpmfc_driver_info_t *all_boards_info (info struct pointer)

*****

```

2.2.150 ccurPMFC_Get_Interrupt_Timeout_Seconds()

This call returns the read time out maintained by the driver. It is the time that the read call will wait before it times out. The call could time out because a DMA fails to complete. The device should have been opened in the block mode (*O_NONBLOCK* not set) for reads to wait for the operation to complete.

*****
```

2.2.151 ccurPMFC_Get_Lib_Error()

This call provides detailed information about the last library error that was maintained by the API. The call itself can fail with a return code if an invalid handle is provided, the device is not open or device authorization has failed. If the call succeeds *CCURPMFC_LIB_NO_ERROR*, the last library error information is supplied to the user in the *ccurpmfc_lib_error_t* structure.

```

        # CCURPMFC_LIB_NO_LOCAL_REGION   (local region not present)
*****

```

2.2.156 ccurPMFC_Get_Open_File_Descriptor()

When the library *ccurPMFC_Open()* call is successfully invoked, the board is opened using the system call *open(2)*. The file descriptor associated with this board is returned to the user with this call. This call allows advanced users to bypass the library and communicate directly with the driver with calls like *read(2)*, *ioctl(2)*, etc. Normally, this is not recommended as internal checking and locking is bypassed and the library calls can no longer maintain integrity of the functions. This is only provided for advanced users who want more control and are aware of the implications.

```

*****
_ccurpmfc_lib_error_number_t
ccurPMFC_Get_Open_File_Descriptor (void *Handle,
                                    int   *fd)

Description: Get Open File Descriptor

Input: void           *Handle      (Handle pointer)
Output: int            *fd         (open file descriptor)

2.2.157 ccurPMFC_Get_Physical_Memory()

This call returns to the user the physical memory pointer and size that was previously allocated by the `ccurPMFC_Mmap_Physical_Memory()` call. The physical memory is allocated by the user when they wish to perform their own DMA and bypass the API. Once again, this call is only useful for advanced users.

```
*****
    _ccurpmfc_lib_error_number_t
    ccurPMFC_Get_Physical_Memory (void           *Handle,
                                  _ccurpmfc_user_phys_mem_t *phys_mem)

    Description: Get previously mmaped() physical memory address and size

    Input:   void           *Handle           (Handle pointer)
             _ccurpmfc_user_phys_mem_t *phys_mem      (mem struct pointer)
             void           *mmaped_user_mem_ptr (mmaped user virtual
                                         memory)

    Output:  _ccurpmfc_user_phys_mem_t *phys_mem      (mem struct pointer)
             uint            user_pid
             void            *phys_mem_ptr
             void            *driver_virt_mem_ptr
             void            *mmaped_user_mem_ptr
             uint            phys_mem_size
             uint            phys_mem_size_freed
             uint            entry_num_in_tran_table
             uint            num_of_entries_used

    Return:  _ccurpmfc_lib_error_number_t
             # CCURPMFC_LIB_NO_ERROR          (successful)
             # CCURPMFC_LIB_BAD_HANDLE        (no/bad handler supplied)
             # CCURPMFC_LIB_NOT_OPEN         (device not open)
             # CCURPMFC_LIB_INVALID_ARG       (invalid argument)
             # CCURPMFC_LIB_IOCTL_FAILED     (driver ioctl call failed)
*****

```

2.2.158 ccurPMFC_Get_RunCount_UserProcess()

This call returns to the user a count of the number of times the User Process has entered. (*This is an experimental API for debugging and testing*).

```
*****
    _ccurpmfc_lib_error_number_t
    ccurPMFC_Get_RunCount_UserProcess(void           *UFuncHandle,
                                       unsigned int long long *RunCount)

    Description: Get run count in user process

    Input:   void           *UFuncHandle (UF Handle pointer))
    Output:  unsigned int long long *RunCount   (pointer to run count)
    Return:  _ccurpmfc_lib_error_number_t
             # CCURPMFC_LIB_NO_ERROR          (successful)
             # CCURPMFC_LIB_BAD_HANDLE        (no/bad handler supplied)
*****

```

2.2.159 ccurPMFC_Get_TestBus_Control()

This call is provided for internal use in testing the hardware.

```
*****
    _ccurpmfc_lib_error_number_t
    ccurPMFC_Get_TestBus_Control (void           *Handle,
                                 _ccurpmfc_testbus_control_t *test_control)

    Description: Return the value of the Test Bus control information

```

All information contained in this document is confidential and proprietary to Concurrent Real-Time. No part of this document may be reproduced, transmitted, in any form, without the prior written permission of Concurrent Real-Time. No license, expressed or implied, under any patent, copyright or trade secret right is granted or implied by the conveyance of this document.

```

Input:    void                      *Handle          (handle pointer)
Output:   _ccurpmfc_testbus_control_t
          *test_control (pointer to control select)
          # CCURPMFC_TBUS_CONTROL_OPEN
          # CCURPMFC_TBUS_CONTROL_CAL_BUS
Return:   _ccurpmfc_lib_error_number_t
          # CCURPMFC_LIB_NO_ERROR          (successful)
          # CCURPMFC_LIB_NO_LOCAL_REGION  (local region error)
          # CCURPMFC_LIB_BAD_HANDLE       (no/bad handler supplied)
          # CCURPMFC_LIB_NOT_OPEN         (device not open)
*****

```

2.2.160 ccurPMFC_Get_Value()

This call allows the user to read the board registers. The actual data returned will depend on the command register information that is requested. Refer to the hardware manual for more information on what is being returned. Most commands return a pointer to an unsigned integer.

```

*****
_ccurpmfc_lib_error_number_t
ccurPMFC_Get_Value (void           *Handle,
                     CCURPMFC_CONTROL cmd,
                     void             *value)

Description: Return the value of the specified board register.

Input:    void                      *Handle          (Handle pointer)
          CCURPMFC_CONTROL   cmd          (register definition)
          -- structure in ccurpmfc.h
Output:   void                      *value;        (pointer to value)
Return:   _ccurpmfc_lib_error_number_t
          # CCURPMFC_LIB_NO_ERROR          (successful)
          # CCURPMFC_LIB_BAD_HANDLE       (no/bad handler supplied)
          # CCURPMFC_LIB_NOT_OPEN         (device not open)
          # CCURPMFC_LIB_INVALID_ARG     (invalid argument)
          # CCURPMFC_LIB_NO_LOCAL_REGION  (local region not present)
*****

```

2.2.161 ccurPMFC_Hex_To_Fraction()

This call converts a hexadecimal value to a fractional decimal.

```

*****
double
ccurPMFC_Hex_To_Fraction (uint value)

Description: Convert Hexadecimal to Fractional Decimal

Input:    uint      value          (hexadecimal to convert)
Output:   none
Return:   double    Fraction      (converted fractional value)
*****

```

2.2.162 ccurPMFC_Identify_Board()

This call is useful in identifying a physical board via software control. It causes the front LED to either flash or stay steady.

```

*****
_ccurpmfc_lib_error_number_t
ccurPMFC_Identify_Board (void           *Handle,
                         _ccurpmfc_identify_t Identify)
*****
```

All information contained in this document is confidential and proprietary to Concurrent Real-Time. No part of this document may be reproduced, transmitted, in any form, without the prior written permission of Concurrent Real-Time. No license, expressed or implied, under any patent, copyright or trade secret right is granted or implied by the conveyance of this document.

```

Description: Identify the board by setting the front LED

Input:    void                  *Handle          (Handle pointer)
          _ccurpmfc_identify_t Identify      (Identify board settings)
          # CCURPMFC_IDENTIFY_OFF
          # CCURPMFC_IDENTIFY_ON
          # Number of seconds to blink

Output:   none

Return:   _ccurpmfc_lib_error_number_t
          # CCURPMFC_LIB_NO_ERROR          (successful)
          # CCURPMFC_LIB_BAD_HANDLE       (no/bad handler supplied)
          # CCURPMFC_LIB_NO_LOCAL_REGION  (local region not present)
          # CCURPMFC_LIB_NOT_OPEN         (device not open)
          # CCURPMFC_LIB_INVALID_ARG      (invalid argument)
*****

```

2.2.163 ccurPMFC_Initialize_Board()

This call resets the board to a default initial state. This call is currently identical to the *ccurPMFC_Reset_Board()* call.

```

*****
_ccurpmfc_lib_error_number_t
ccurPMFC_Initialize_Board (void *Handle)

Description: Initialize the board.

Input:    void                  *Handle          (Handle pointer)
Output:   none
Return:   _ccurpmfc_lib_error_number_t
          # CCURPMFC_LIB_NO_ERROR          (successful)
          # CCURPMFC_LIB_BAD_HANDLE       (no/bad handler supplied)
          # CCURPMFC_LIB_NOT_OPEN         (device not open)
          # CCURPMFC_LIB_IOCTL_FAILED     (driver ioctl call failed)
          # CCURPMFC_LIB_NO_LOCAL_REGION  (local region not present)
*****

```

2.2.164 ccurPMFC_IpCore_COS_Activate()

This call is the first call to use after the system is powered up to enable the IpCore COS module. This call can also be used to de-activate the module and get the current state of the module.

```

*****
_ccurpmfc_lib_error_number_t
ccurPMFC_IpCore_COS_Activate (void
                               _ccurpmfc_ipcore_cos_ip_enable_t      *Handle,
                               _ccurpmfc_ipcore_cos_status_disabled_t activate,
                               _ccurpmfc_ipcore_cos_status_disabled_t *current_state)

Description: Activate/DeActivate IP Core COS module

Input:    void                  *Handle          (Handle pointer)
          _ccurpmfc_ipcore_cos_ip_enable_t      activate (activate/deactivate)
          # CCURPMFC_IPCORE_COS_IP_ENABLE
          # CCURPMFC_IPCORE_COS_IP_DISABLE
          # CCURPMFC_IPCODE_COS_IP_DO_NOT_CHANGE
Output:   _ccurpmfc_ipcore_cos_status_disabled_t *current_state
          # CCURPMFC_IPCORE_COS_STATUS_IP_ENABLED
          # CCURPMFC_IPCORE_COS_STATUS_IP_DISABLED
Return:   _ccurpmfc_lib_error_number_t
          # CCURPMFC_LIB_NO_ERROR          (successful)

```

All information contained in this document is confidential and proprietary to Concurrent Real-Time. No license, expressed or implied, under any patent, copyright or trade secret right is granted or implied by the conveyance of this document.

```

# CCURPMFC_LIB_BAD_HANDLE          (no/bad handler supplied)
# CCURPMFC_LIB_NOT_OPEN           (device not open)
# CCURPMFC_LIB_INVALID_ARG        (invalid argument)
# CCURPMFC_LIB_NO_LOCAL_REGION    (local region not present)
# CCURPMFC_LIB_NO_RESOURCE         (COS ip core not present)
*****

```

2.2.165 ccurPMFC_IpCore_COS_Configure()

The purpose of this call is to configure the Ip Core COS module. If the core is not active, it will activate it. User can decide to immediately start capture at the end of the configuration with the StartStop option. The test mode is simply provided for debugging the hardware and software. Users need to specify at least one channel to detect a change of state, otherwise the call will fail.

A point to note is that when this call is issued, the sampling timer is restarted.

```

/*****
 _ccurpmfc_lib_error_number_t
ccurPMFC_IpCore_COS_Configure (void                                     *Handle,
                               ccurpmfc_ipcore_cos_configure_t *config)

Description: Configure IP Core Change-of-State

Input:   void                           *Handle (Handle pointer)
Output:  ccurpmfc_ipcore_cos_configure_t  *config (pointer to config Struct)
         u_int32_t                      StartStop

*****

```

2.2.168 ccurPMFC_IpCore_COS_Read()

This call reads the COS FIFO and returns any raw change-of-state elements that have been detected by the firmware. The maximum size of the FIFO is *CCURPMFC_IPCORE_COS_MAX_READ_ELEMENTS* elements. The call requires as input the number of samples to read. This can be any number between 1 and *CCURPMFC_IPCORE_COS_MAX_READ_ELEMENTS*. Additionally, the user needs to select the mode of transfer, i.e. DMA or PIO. If DMA mode is selected, the user has the option to select the DMA engine *CCURPMFC_DMA0* or *CCURPMFC_DMA1*. An additional option to this call is to decode any raw change-of-state elements detected by setting the *timestamp* option to *CCURPMFC_TRUE*.

The call returns the number of elements that it read along with the raw and decoded information. If an overflow condition occurs (i.e. the FIFO gets full and the firmware is unable to add another change of state detected) all available elements are returned up to the user requested count and the overflow condition is cleared. Overflow can occur if the rate of change in state detection is very high and the application is unable to read the FIFO before turning around to collect more data. In that case, the application needs to speed up the process of capturing the data or reducing the rate of change of state.

```

*****

```

2.2.170 ccurPMFC_IpCore_Get_Info()

This call returns information of all the IP Core modules available. The COS core will return a *CCURPMFC_IPCODE_CHANGE_OF_STATE* code in *IpCoreCode*. Additional information about the core is also returned.

This call also returns to the user a memory mapped pointer address that the user can use to directly access the IP Core and bypass the driver and API. This type of access to the hardware should only be performed by Advanced users who are extremely familiar with both the hardware and internals of the core, otherwise, the system operation could be compromised.

```

```

2.2.172 ccurPMFC_MMap_Physical_Memory()

This call is provided for advanced users to create a physical memory of specified size that can be used for DMA. The allocated DMA memory is rounded to a page size. If a physical memory is not available, this call will fail, at which point the user will need to issue the *ccurPMFC_Munmap_Physical_Memory()* API call to remove the previously allocated physical memory.

```

*****_ccurpmfc_lib_error_number_t
ccurPMFC_MMap_Physical_Memory (void                                *Handle,

```

2.2.173 ccurPMFC_MsgDma_Configure_Descriptor()

This call assists the user in setting up modular scatter-gather DMA descriptors. It allows the user to specify a read and write address offset along with length of transfer. Additionally, the call also provides the option to attach to other previously created descriptor blocks for scatter-gather operation. To perform scatter-gather DMA operation, the user creates a chain of descriptors, each having its own read/write/length information along with a start and end of the chain. The DMA operation is started from the first descriptor block in the chain and sequentially processes the descriptor blocks until the last descriptor block in the chain is processed.

To distinguish between descriptors, they are labeled with descriptor ID's. They range from ID 1 to 31. Users can supply a valid specific ID to this call or let the call itself find a free descriptor ID available. It is entirely left up to the user to determine how to manage the various descriptors and their relative linkages.

If the user wishes to have a previously created descriptor to point to a newly created descriptor, they can supply the previously created descriptor ID to the *AttachToDescriptorID* argument in the newly created descriptor. The newly created descriptor will not point to any descriptor and will always be the last descriptor in the chain.

DMA transfers can occur from either of the following:

1. Physical PCIe memory to Physical PCIe memory
2. Physical PCIe memory to Avalon Memory
3. Avalon Memory to Physical PCIe memory
4. Avalon Memory to Avalon Memory

There are certain restrictions and limitations to this scatter-gather operation:

1. Scatter-gather DMA is only supported in certain FPGA cards
2. Reads from Avalon memory below DiagRam location are not allowed.
3. Invalid memory address supplied could result in the scatter-gather IP to lock up and the only way to recover will be to reload the driver.
4. Read and write addresses must be at a minimum full-word aligned and for maximum performance, it is recommended to be quad-word aligned.
5. Lengths are in bytes and must be at a minimum a multiple of a full-word and for maximum performance, it is recommended to be quad-word multiple.
6. You cannot cause a chain of descriptors to loop on itself.

```

*****

```

2.2.174 *ccurPMFC_MsgDma_Configure_Single()*

This call performs a similar function to the *ccurPMFC_MsgDma_Configure()* call with the exception that no DMA chaining is performed and only the single descriptor ID-1 is used to perform the DMA operation. The user has the option to supply a valid descriptor block when using the *ccurPMFC_MsgDma_Configure_Single()* API or a *NULL* pointer to the descriptor as an argument when using the *ccurPMFC_Transfer_Data()* API to perform the transfer.

Normally this call needs to be issued once with a *NULL* pointer for the *Descriptor* (*i.e. during initialization*) prior to using the *ccurPMFC_Transfer_Data()* call with the *LibMode* set to *CCURPMFC_LIBRARY_MSGDMA_MOD*. In this way, the descriptor ID-1 will be set up correctly prior to the transfer.

If instead, the user wishes to perform the DMA operation using the *ccurPMFC_MsgDma_Fire_Single()* call, they need to issue the *ccurPMFC_MsgDma_Configure_Single()* call with a valid descriptor block, otherwise, results will be unpredictable.

```

# (MSG DMA Reads not allowed
# for selected address)
*****

```

2.2.175 ccurPMFC_MsgDma_Fire()

This call commences a scatter-gather DMA operation that has been previously configured and setup by the *ccurPMFC_MsgDma_Configure()* and *ccurPMFC_MsgDma_Setup()* call.

The *StartDescriptorID* can be set to either ‘0’ or a valid Descriptor ID. Normally, the user will set the *StartDescriptorID* in the *ccurPMFC_MsgDma_Setup()* API during initialization and set it to ‘0’ in this *ccurPMFC_MsgDma_Fire()* API. In this way, this call will not suffer the overhead of loading the *StartDescriptorID* in the internal prefetcher register when repeatedly calling the *ccurPMFC_MsgDma_Fire()* API. If the user specifies a valid *StartDescriptorID* that is already setup as a scatter-gather chain using the *ccurPMFC_MsgDma_Configure()* call, then this *ccurPMFC_MsgDma_Fire()* API will initiate the DMA starting with the user supplied start descriptor ID.

The *DescriptorIDMask* is a mask of all the valid descriptor ID’s specified in the scatter-gather chain that was created earlier with the *ccurPMFC_MsgDma_Configure()* API. If this is incorrectly specified, the DMA operation will be unpredictable. This *ccurPMFC_MsgDma_Fire()* API call uses this mask to set the *ControlWord* for each of the IDs. Specifying this mask reduces the overhead in the call by not searching the scatter-gather chain to set the individual control words.

ControlWord for each descriptor is set based on the *DescriptorIDMask* mask. Normally, the following two flags are set:

- CCURPMFC_MSGD_DESC_CONTROL_GO
- CCURPMFC_MSGD_DESC_CONTROL_OWNED_BY_HW

LastIdForInterrupts is set to 0 if the DMA operation should use polling instead of using interrupts. If interrupts are to be used, the ID of the last descriptor in the DMA chain is to be specified. This is the ID that will be interrupted when the entire chain is completed. Incorrect ID entered will result in unpredictable results. Normally, interrupt handling adds additional overhead and reduces performance, however, it reduces the overhead experienced by the CPU and PCIe bus during polling.

Once the scatter-gather DMA operation commences, it performs DMA operations starting with the *StartDescriptorID* and traversing through the chain sequentially until it reaches the last descriptor ID in the chain, at which point the DMA operation concludes.

```

2.2.176 `ccurPMFC_MsgDma_Fire_Single()`

This call is similar in functionality to the `ccurPMFC_MsgDma_Fire()` call with the exception that it operates on the single descriptor ID-1. It can be used when a single DMA rather than scatter-gather DMA operation needs to be performed. This call can be called once the `ccurPMFC_MsgDma_Config_Single()` call has been issued to set up the read/write address offset and length of transfer. Unless the read/write address offset or length of transfer is changed, the `ccurPMFC_MsgDma_Fire_Single()` call can be made repeatedly to perform the same DMA operation.

```

/*****
_ccurpmfc_lib_error_number_t
_ccurPMFC_MsgDma_Fire_Single (void *Handle,
                               int UseInterrupts)

Description: Fire Single Modular Scatter-Gather DMA descriptor

Input:   void *Handle                      (Handle pointer)
        int UseInterrupts                 (Use interrupts flag)
        # CCURPMFC_TRUE
        # CCURPMFC_FALSE
Output: none
Return: _ccurpmfc_lib_error_number_t
        # CCURPMFC_LIB_NO_ERROR          (successful)
        # CCURPMFC_LIB_INVALID_ARG      (invalid argument)
        # CCURPMFC_LIB_DMA_FAILED       (DMA failed)
        # CCURPMFC_LIB_DMA_BUSY         (DMA busy)
*****

```

UseInterrupts is a flag that can be set to specify if interrupt handling should be enabled.

2.2.177 `ccurPMFC_MsgDma_Free_Descriptor()`

This call can be used to free up already used descriptors.

```

/*****
_ccurpmfc_lib_error_number_t
ccurPMFC_MsgDma_Free_Descriptor (void *Handle,
                                  _ccurpmfc_msdma_descriptors_id_mask_t DescriptorIDMask)

Description: Free Modular Scatter-Gather DMA descriptor

Input:   void *Handle                      (*Handle (Handle pointer))
        _ccurpmfc_msdma_descriptors_id_mask_t DescriptorIDMask

```

        # CCURPMFC_LIB_NOT_OWNER_OF_MSGDMA (not owner of modular
                                             scatter-gather)

*****

```

2.2.182 *ccurPMFC_MsgDma_Seize()*

Modular Scatter-Gather DMA is a two part operation. The first part is to configure the Scatter-Gather DMA and the second part is to execute the DMA. Various MsgDma API calls have been provided for this. Since this two part operation is not autonomous, it is necessary for the user of these calls to prevent other applications from configuring and using the MsgDMA resources while it is being actively used by another application. For this reason, the *ccurPMFC_MsgDma_Seize()* and *ccurPMFC_MsgDma_Release()* API calls have been introduced to assist the user in preventing other applications from accessing the Scatter-Gather DMA resource while it is reserved. Basically, before any MsgDma API call is issued that could modify the setting and execution of the MsgDma operation, the user needs to issue the *ccurPMFC_MsgDma_Seize()* API call once. In this way, on one else will have access to the MsgDma resource until the application has issued the *ccurPMFC_MsgDma_Release()* API call or has terminated.

```

*****
_ccurpmfc_lib_error_number_t ccurPMFC_MsgDma_Seize (void *Handle)

Description: Seize MsgDMA operation for private to use and become owner

Input:   void                                *Handle (Handle pointer)
Output:  none
Return: _ccurpmfc_lib_error_number_t
        # CCURPMFC_LIB_NO_ERROR          (successful)
        # CCURPMFC_LIB_BAD_HANDLE       (no/bad handler supplied)
        # CCURPMFC_LIB_NOT_OPEN         (device not open)

use)
*****

```

2.2.183 ccurPMFC_MsgDma_Setup()

This call is used in conjunction with the *ccurPMFC_MsgDma_Configure()* and *ccurPMFC_MsgDma_Fire()* calls. This call is made after all the descriptors are first configured with the help of the *ccurPMFC_MsgDma_Configure()* call. The purpose of this call is to specify the first descriptor in the chain. Additionally, the user can set the *ForceReset* flag to reset the dispatcher and prefetcher. Optionally, the user can request useful active descriptor information if *ActiveDescriptorsInfo* argument is specified (*i.e not NULL*). In addition to returning useful active descriptor information, the descriptor chain and prefetcher settings are also validated for proper configuration.

```

*****
_ccurpmfc_lib_error_number_t

```

        void    *mmapped_user_mem_ptr)

Description: Unmap a previously mapped physical DMA memory.

Input:   void          *Handle           (Handle pointer)
Output:  void          *mmapped_user_mem_ptr (virtual memory pointer)
Return:  _ccurpmfc_lib_error_number_t
         # CCURPMFC_LIB_NO_ERROR           (successful)
         # CCURPMFC_LIB_BAD_HANDLE        (no/bad handler supplied)
         # CCURPMFC_LIB_NOT_OPEN         (device not open)
         # CCURPMFC_LIB_INVALID_ARG      (invalid argument)
         # CCURPMFC_LIB_MUNMAP_FAILED    (failed to un-map memory)
         # CCURPMFC_LIB_NOT_MAPPED       (memory not mapped)
*****

```

2.2.185 ccurPMFC_NanoDelay()

This call goes into a tight loop spinning for the requested nano seconds specified by the user.

```

/*****************
void
ccurPMFC_NanoDelay (unsigned long long NanoDelay)

Description: Delay (loop) for user specified nano-seconds

Input:   unsigned long long NanoDelay      (number of nano-secs to delay)
Output:  none
Return:  none
*****

```

2.2.186 ccurPMFC_Open()

This is the first call that needs to be issued by a user to open a device and access the board through the rest of the API calls. What is returned is a handle to a *void pointer* that is supplied as an argument to the other API calls. The *Board_Number* is a valid board number [0..9] that is associated with a physical card. There must exist a character special file */dev/ccurpmfc<Board_Number>* for the call to be successful. One character special file is created for each board found when the driver is successfully loaded.

The *oflag* is the flag supplied to the *open(2)* system call by this API. It is normally a 0, however the user may use the *O_NONBLOCK* option for *read(2)* calls which will change the default reading in block mode.

In case of error, *errno* is also set for some non-system related errors encountered.

```

/*****************
_ccurpmfc_lib_error_number_t
ccurPMFC_Open (void    **My_Handle,
               int      Board_Number,
               int      oflag)

Description: Open a device.

Input:   void          **Handle          (Handle pointer to pointer)
        int           Board_Number        (0-9 board number)
        int           oflag             (open flags)
Output:  none
Return:  _ccurpmfc_lib_error_number_t
         # CCURPMFC_LIB_NO_ERROR           (successful)
         # CCURPMFC_LIB_INVALID_ARG       (invalid argument)
         # CCURPMFC_LIB_ALREADY_OPEN     (device already opened)

```

2.2.187 ccurPMFC_Pause_UserProcess()

This call causes a running User Process to sleep for user specified micro-seconds. (*This is an experimental API for debugging and testing.*)

```

*****  

_ccurpmfc_lib_error_number_t  

ccurPMFC_Pause_UserProcess(void *UFuncHandle,  

                           int usleep)  

  

Description: Pause running user process  

  

Input:   void           *UFuncHandle (UF Handle pointer)  

         int            usleep      (micro-seconds sleep)  

Output:  none  

Return:  _ccurpmfc_lib_error_number_t  

         # CCURPMFC_LIB_NO_ERROR          (successful)  

         # CCURPMFC_LIB_BAD_HANDLE       (no/bad handler supplied)  

*****
```

2.2.188 ccurPMFC_Program_All_Output_Clocks()

This is the main call to program all the output clocks with a single call. All existing clock activity is stopped and replaced with the new clocks selection. Though the user can select the Input Clock Frequency with this call, it is expected that they will use the default CCURPMFC_DEFAULT_INPUT_CLOCK_FREQUENCY value.

The input clock can be one of:

CCURPMFC(CG)_INPUT_CLOCK_SELECT_N0	→ 10MHz TCXO (Temperature Compensated Oscillator Clock).
CCURPMFC(CG)_INPUT_CLOCK_SELECT_N1	→ External Input
CCURPMFC(CG)_INPUT_CLOCK_SELECT_N2	→ FPGA Supplied
CCURPMFC(CG)_INPUT_CLOCK_SELECT_NXAXB	→ Not used

When using this card, the default clock should be set to *CCURPMFC(CG)_INPUT_CLOCK_SELECT_N0* i.e. the 10MHz internal clock.

If the desired output clock frequencies are unable to be computed due to hardware limitation, they may wish to increase the desired tolerance for the particular clock. Note that this tolerance is only applicable to computing a clock value as close to the desired frequency and not a representation of the accuracy of the output clocks.

Additionally, the programming could fail if the number of N-Divider resource gets exhausted due to the user selecting several output clocks with widely different output clocks.

```

```

2.2.189 ccurPMFC_Read()

Currently, this call is not supported. It basically calls the *read(2)* system call with the exception that it performs necessary *locking* and returns the *errno* returned from the system call in the pointer to the *error* variable.

For specific information about the data being returned for the various read modes, refer to the *read(2)* system call description the *Driver Direct Access* section.

```

*****
_ccurpmfc_lib_error_number_t
ccurPMFC_Read (void      *Handle,
                void      *buf,
                int       size,
                int       *bytes_read,
                int       *error)

Description: Perform a read operation.

Input:   void      *Handle           (Handle pointer)
         int       size            (size of buffer in bytes)
Output:  void      *buf             (pointer to buffer)
         int       *bytes_read    (bytes read)
         int       *error          (returned errno)
Return:  _ccurpmfc_lib_error_number_t
         # CCURPMFC_LIB_NO_ERROR (successful)
         # CCURPMFC_LIB_BAD_HANDLE (no/bad handler supplied)

         # CCURPMFC_LIB_IO_ERROR   (read failed)
*****

```

2.2.190 ccurPMFC_Reload_Firmware()

The purpose of this call is to power cycle the board which in turn will reload the latest firmware on the board.

```

*****
ccurPMFC_Reload_Firmware()

Description: This call power-cycles the board which in turn forces it to
             reload its firmware. Typically, this is called after a new
             firmware has been installed in the board. This saves the need
             to perform a system reboot after a firmware installation.

Input:   void *Handle           (Handle pointer)
Output:  none
Return:  _ccurpmfc_lib_error_number_t
         # CCURPMFC_LIB_NO_ERROR (successful)
         # CCURPMFC_LIB_BAD_HANDLE (no/bad handler supplied)
         # CCURPMFC_LIB_NOT_OPEN  (device not open)
         # CCURPMFC_LIB_IOCTL_FAILED (driver ioctl call failed)
*****

```

2.2.191 ccurPMFC_Remove_Irq()

The purpose of this call is to remove the interrupt handler that was previously set up. The interrupt handler is managed internally by the driver and the library. The user should not issue this call, otherwise reads will time out.

All information contained in this document is confidential and proprietary to Concurrent Real-Time. No part of this document may be reproduced, transmitted, in any form, without the prior written permission of Concurrent Real-Time. No license, expressed or implied, under any patent, copyright or trade secret right is granted or implied by the conveyance of this document.

```

*****
    _ccurpmfc_lib_error_number_t
    ccurPMFC_Remove_Irq (void *Handle)

Description: By default, the driver sets up a shared IRQ interrupt handler
when the device is opened. Now if for any reason, another
device is sharing the same IRQ as this driver, the interrupt
handler will also be entered every time the other shared
device generates an interrupt. There are times that a user,
for performance reasons may wish to run the board without
interrupts enabled. In that case, they can issue this ioctl
to remove the interrupt handling capability from the driver.

Input:   void *Handle           (Handle pointer)
Output:  none
Return:  _ccurpmfc_lib_error_number_t
        # CCURPMFC_LIB_NO_ERROR      (successful)
        # CCURPMFC_LIB_BAD_HANDLE   (no/bad handler supplied)
        # CCURPMFC_LIB_NOT_OPEN     (device not open)
        # CCURPMFC_LIB_IOCTL_FAILED (driver ioctl call failed)
*****

```

2.2.192 ccurPMFC_Reset_Board()

This call resets the board to a known initial default state. This call is currently identical to the *ccurPMFC_Initialize_Board()* call.

```

*****
    _ccurpmfc_lib_error_number_t
    ccurPMFC_Reset_Board (void *Handle)

Description: Reset the board.

Input:   void *Handle           (Handle pointer)
Output:  none
Return:  _ccurpmfc_lib_error_number_t
        # CCURPMFC_LIB_NO_ERROR      (successful)
        # CCURPMFC_LIB_BAD_HANDLE   (no/bad handler supplied)
        # CCURPMFC_LIB_NOT_OPEN     (device not open)
        # CCURPMFC_LIB_IOCTL_FAILED (driver ioctl call failed)
        # CCURPMFC_LIB_NO_LOCAL_REGION (local region not present)
*****

```

2.2.193 ccurPMFC_Reset_Clock()

This call performs a hardware reset of the clock. All active output clocks are stopped and set to default state.

```

*****
    _ccurpmfc_lib_error_number_t
    ccurPMFC_Reset_Clock (void *Handle,
                          int activate)

Description: Perform Hardware Clock Reset

Input:   void             *Handle   (Handle pointer)
        int               activate (1=activate after reset)
Output:  none
Return:  _ccurpmfc_lib_error_number_t
        # CCURPMFC_LIB_NO_ERROR      (successful)
        # CCURPMFC_LIB_BAD_HANDLE   (no/bad handler supplied)

*****

```

2.2.204 ccurPMFC_Set_Interrupt_Timeout_Seconds()

This call sets the read *timeout* maintained by the driver. It allows the user to change the default time out from 30 seconds to a user specified value. It is the time that the read call will wait before it times out. The call could time out if the DMA fails to complete. The device should have been opened in the blocking mode (*O_NONBLOCK not set*) for reads to wait for the operation to complete.

```

 *****
 _ccurpmfc_lib_error_number_t
ccurPMFC_Set_Interrupt_Timeout_Seconds (void      *Handle,
                                         int           timeout_secs)

Description: Set Interrupt Timeout Seconds

Input:   void            *Handle          (Handle pointer)
         int             timeout_secs    (interrupt tout secs)
Output:  none
Return:  _ccurpmfc_lib_error_number_t
        # CCURPMFC_LIB_NO_ERROR          (successful)
        # CCURPMFC_LIB_BAD_HANDLE       (no/bad handler supplied)
        # CCURPMFC_LIB_NOT_OPEN         (device not open)
        # CCURPMFC_LIB_INVALID_ARG      (invalid argument)

*****

```

2.2.205 ccurPMFC_Set_TestBus_Control()

This call is provided for internal use in testing the hardware.

```

 *****
 _ccurpmfc_lib_error_number_t
ccurPMFC_Set_TestBus_Control (void                  *Handle,
                               _ccurpmfc_testbus_control_t test_control)

Description: Set the value of the Test Bus control information

Input:   void            *Handle          (handle pointer)
Output:  _ccurpmfc_testbus_control_t
         test_control    (control select)
         # CCURPMFC_TBUS_CONTROL_OPEN
         # CCURPMFC_TBUS_CONTROL_CAL_BUS
Return:  _ccurpmfc_lib_error_number_t
        # CCURPMFC_LIB_NO_ERROR          (successful)
        # CCURPMFC_LIB_NO_LOCAL_REGION  (local region error)
        # CCURPMFC_LIB_BAD_HANDLE       (no/bad handler supplied)
        # CCURPMFC_LIB_NOT_OPEN         (device not open)

*****

```

2.2.206 ccurPMFC_Set_Value()

This call allows the advanced user to set the writable board registers. The actual data written will depend on the command register information that is requested. Refer to the hardware manual for more information on what can be written to.

Normally, users should not be changing these registers as it will bypass the API integrity and could result in an unpredictable outcome.

```
/*****************************************************************************  
_ccurpmfc_lib_error_number_t  
ccurPMFC_Set_Value (void *Handle,  
                    CCURPMFC_CONTROL cmd,  
                    void *value)  
  
Description: Set the value of the specified board register.  
  
Input:    void             *Handle          (Handle pointer)  
          CCURPMFC_CONTROL cmd           (register definition)  
          -- structure in ccurpmfc_lib.h  
          void             *value          (pointer to value to be set)  
Output:   none  
Return:   _ccurpmfc_lib_error_number_t  
          # CCURPMFC_LIB_NO_ERROR      (successful)  
          # CCURPMFC_LIB_BAD_HANDLE    (no/bad handler supplied)  
          # CCURPMFC_LIB_NOT_OPEN     (device not open)  
          # CCURPMFC_LIB_INVALID_ARG   (invalid argument)  
******/
```

2.2.207 ccurPMFC_SPROM_Read()

This is a basic call to read short word entries from the serial prom. The user specifies a word offset within the serial prom and a word count, and the call returns the data read in a pointer to short words.

```
/*****************************************************************************  
_ccurpmfc_lib_error_number_t  
ccurPMFC_SPROM_Read(void *Handle,  
                     ccurpmfc_sprom_rw_t *spr)  
  
Description: Read Serial Prom for specified number of words  
  
Input:    void             *Handle          (handle pointer)  
          ccurpmfc_sprom_rw_t *spr          (pointer to struct)  
          u_short word_offset  
          u_short num_words  
Output:   ccurpmfc_sprom_rw_t *spr          (pointer to struct)  
          u_short *data_ptr  
Return:   CCURPMFC_LIB_NO_ERROR      (successful)  
          CCURPMFC_LIB_NO_LOCAL_REGION    (error)  
          CCURPMFC_LIB_INVALID_ARG      (invalid argument)  
          CCURPMFC_LIB_SERIAL_PROM_BUSY (serial prom busy)  
          CCURPMFC_LIB_SERIAL_PROM_FAILURE (serial prom failure)

```

2.2.208 ccurPMFC_SPROM_Read_Item()

This call is used to read well defined sections in the serial prom. The user supplies the serial prom section that needs to be read and the data is returned in a section specific structure.

```
/*****************************************************************************  
_ccurpmfc_lib_error_number_t  
ccurPMFC_SPROM_Read_Item(void *Handle,  
                         ccurpmfc_sprom_access_t item,  
                         ...)
```

All information contained in this document is confidential and proprietary to Concurrent Real-Time. No part of this document may be reproduced, transmitted, in any form, without the prior written permission of Concurrent Real-Time. No license, expressed or implied, under any patent, copyright or trade secret right is granted or implied by the conveyance of this document.

```

void *item_ptr)

Description: Read Serial Prom for specified item

Input:      void          *Handle    (handle pointer)
            _ccurpmfc_sprom_access_t item   (select item)
            # CCURPMFC_SPROM_HEADER
Output:     void          *item_ptr (pointer to item struct)
            *ccurpmfc_sprom_header_t sprom_header
            u_int32_t           board_serial_number
            u_short             sprom_revision
Return:     CCURPMFC_LIB_NO_ERROR      (successful)
            CCURPMFC_LIB_NO_LOCAL_REGION (error)
            CCURPMFC_LIB_INVALID_ARG   (invalid argument)
            CCURPMFC_LIB_SERIAL_PROM_BUSY (serial prom busy)
            CCURPMFC_LIB_SERIAL_PROM_FAILURE (serial prom failure)
*****

```

2.2.209 ccurPMFC_SPROM_Write()

This is a basic call to write short word entries to the serial prom. The user specifies a word offset within the serial prom and a word count, and the call writes the data pointed to by the *spw* pointer, in short words.

Prior to using this call, the user will need to issue the *ccurPMFC_SPROM_Write_Override()* to allow writing to the serial prom.

```

/*****
_ccurpmfc_lib_error_number_t
ccurPMFC_SPROM_Write(void          *Handle,
                      ccurpmfc_sprom_rw_t *spw)

Description: Write data to Serial Prom for specified number of words

Input:      void          *Handle    (handle pointer)
            ccurpmfc_sprom_rw_t *spw      (pointer to struct)
            u_short word_offset
            u_short num_words
            u_short *data_ptr
Output:     none
Return:     CCURPMFC_LIB_NO_ERROR      (successful)
            CCURPMFC_LIB_NO_LOCAL_REGION (error)
            CCURPMFC_LIB_INVALID_ARG   (invalid argument)
            CCURPMFC_LIB_SERIAL_PROM_BUSY (serial prom busy)
            CCURPMFC_LIB_SERIAL_PROM_FAILURE (serial prom failure)
*****

```

2.2.210 ccurPMFC_SPROM_Write_Item()

This call is used to write well defined sections in the serial prom. The user supplies the serial prom section that needs to be written and the data points to the section specific structure. This call should normally not be used by the user.

Prior to using this call, the user will need to issue the *ccurPMFC_SPROM_Write_Override()* to allowing writing to the serial prom.

```

/*****
_ccurpmfc_lib_error_number_t
ccurPMFC_SPROM_Write_Item(void          *Handle,
                           _ccurpmfc_sprom_access_t item,
                           void          *item_ptr)

Description: Write Serial Prom with specified item

```

All information contained in this document is confidential and proprietary to Concurrent Real-Time. No part of this document may be reproduced, transmitted, in any form, without the prior written permission of Concurrent Real-Time. No license, expressed or implied, under any patent, copyright or trade secret right is granted or implied by the conveyance of this document.

```

Input:      void             *Handle    (handle pointer)
           _ccurpmfc_sprom_access_t item   (select item)
           # CCURPMFC_SPROM_HEADER
void        *item_ptr (pointer to item struct)
           *ccurpmfc_sprom_header_t sprom_header
           u_int32_t          board_serial_number
           u_short            sprom_revision
Output:     none
Return:    CCURPMFC_LIB_NO_ERROR      (successful)
           CCURPMFC_LIB_NO_LOCAL_REGION (error)
           CCURPMFC_LIB_INVALID_ARG   (invalid argument)
           CCURPMFC_LIB_SERIAL_PROM_BUSY (serial prom busy)
           CCURPMFC_LIB_SERIAL_PROM_FAILURE (serial prom failure)
*****

```

2.2.211 ccurPMFC_SPROM_Write_Override()

The serial prom is non-volatile and its information is preserved during a power cycle. It contains useful information and settings that the customer could lose if they were to inadvertently overwrite. For this reason, all calls that write to the serial proms will fail with a write protect error, unless this write protect override API is invoked prior to writing to the serial proms. Once the Write Override is enabled, it will stay in effect until the user closes the device or re-issues this call to disable writes to the serial prom.

The calls that will fail unless the write protect is disabled are:

- ccurPMFC_Write_Serial_Prom()
- ccurPMFC_Write_Serial_Prom_Item()

When *action* is set to *CCURPMFC_TRUE*, the serial prom write protecting is disabled, otherwise, it is enabled.

```

*****
_ccurpmfc_lib_error_number_t
ccurPMFC_SPROM_Write_Override (void *Handle,
                               int action)

Description: Set Serial Prom Write Override

Input:      void             *Handle    (handle pointer)
           int              action; (override action)
           # CCURPMFC_TRUE
           # CCURPMFC_FALSE
Output:     none
Return:    CCURPMFC_LIB_NO_ERROR      (successful)
           CCURPMFC_LIB_BAD_HANDLE (no/bad handler supplied)
           CCURPMFC_LIB_NOT_OPEN   (device not open)
           CCURPMFC_LIB_INVALID_ARG (invalid argument)
           CCURPMFC_LIB_NO_LOCAL_REGION (local region not present)
*****

```

2.2.212 ccurPMFC_Transfer_Data()

This this is the main call that the user can use to transfer data from physical memory that the user has previously allocated to a region in the local register, and vice-versa. The operation can be performed via DMA or programmed I/O mode. In the case of DMA mode, the user can select whether interrupts are to be used to wait for DMA to complete instead of polling. User can also specify which DMA engine to use during this operation.

If the board supports modular scatter-gather DMA, then the user can specify that instead of the basic DMA engine. In this case, the user needs to first call the *ccurPMFC_MsgDma_Configure_Single()* with the *NULL* argument to setup descriptor ID-1 for scatter-gather DMA operation.

All information contained in this document is confidential and proprietary to Concurrent Real-Time. No part of this document may be reproduced, transmitted, in any form, without the prior written permission of Concurrent Real-Time. No license, expressed or implied, under any patent, copyright or trade secret right is granted or implied by the conveyance of this document.

When scatter-gather DMA is selected, the *DmaEngineNo* argument is ignored and the *IoControl* argument must be set to *CCURPMFC_DMA_CONTROL_INCREMENT*.

There are certain limitations to modular scatter-gather feature:

1. Scatter-gather DMA is only supported in certain cards
2. Reads from Avalon memory below DiagRam location are not allowed.
3. Invalid memory address supplied could result in the scatter-gather IP to lock up and the only way to recover will be to reload the driver or reboot the system.
4. Read and write addresses must be at a minimum full-word aligned and for maximum performance, it is recommended to be quad-word aligned.
5. Lengths are in bytes and must be at a minimum a multiple of a full-word and for maximum performance, it is recommended to be quad-word multiple.
6. Scatter-gather chaining cannot be performed with this call.

```

3. Test Programs

This driver and API are accompanied with an extensive set of test examples. Examples under the *Direct Driver Access* do not use the API, while those under *Application Program Interface Access* use the API.

3.1 Direct Driver Access Example Tests

These set of tests are located in the `.../test` directory and do not use the API. They communicate directly with the driver. Users should be extremely familiar with both the driver and the hardware registers if they wish to communicate directly with the hardware.

3.1.1 ccurpmfc_disp

Useful program to display the local board registers. This program uses the *curses* library.

```
Usage: ./ccurpmfc_disp [-b BoardNo] [-d Delay] [-l LoopCnt] [-o Offset] [-s Size]
-b BoardNo      (Board number -- default is 0)
-d Delay        (Delay between screen refresh -- default is 0)
-l LoopCnt     (Loop count -- default is 0)
-o Offset       (Hex offset to read from -- default is 0x0)
-s Size         (Number of bytes to read -- default is 0x400)
```

Example display:

```
./ccurpmfc_disp
```

```
Board Number      [-b]: 0
Delay            [-d]: 0 milli-seconds
Loop Count       [-l]: ***Forever***
Offset           [-o]: 0x00000000
Size             [-s]: 1024 (bytes)

ScanCount =      59758

```

3.1.2 ccurpmfc_dma

This test transfers data from physical memory to the Local register area and back. There are three modes of operation. Two are DMA and one is programmed I/O. Depending on the number of DMA engines supported by the card, the user can select one of them to perform the DMA. Area select is one of three areas the user can specify. They represent the area in physical memory and local register where the transfer is to occur. The test automatically switches to a different area corresponding to the DMA engine supplied. If multiple copies of this application is run on the same card using the same DMA engine, then the user needs to manually select a different area ‘A’ so the data mismatch does not occur due to using the same area region.

```
Usage: ./ccurpmfc_dma [-A Area2Select] [-b Board] [-D DMAEngineNo] [-i]
                      [-l LoopCnt] [-m XferMode] [-s Size] [-v VerboseNo]
-A Area2Select (Area to select -- default = -1)
-b Board        (Board number -- default = 0)
-D DMAEngineNo (DMA Engine number -- default = 0)
-i             (Enable Interrupts -- default = Disable)
-l LoopCnt     (Loop Count - default = 1000)
-m XferMode    (Transfer Mode -- default = Simple DMA)
  -md          (Simple DMA mode)
  -mp          (Programmed I/O mode)
  -mx          (Low-Level DMA mode)
-s Size         (Transfer Size (multiple of byte width) - default = 12288)
-v VerboseNo   (Verbose -- default = 0)
```

Example display:

```
./ccurpmfc_dma

Device Name: /dev/ccurpmfc0

3.1.4 ccurpmfc_rdreg

This is a simple program that returns the local register value for a given offset.

```

Usage: ./ccurpmfc_rdreg [-b Board] [-C] [-f] [-o Offset] [-s Size]
-b Board    : Board number -- default board is 0
-C          : Select Config Registers instead of Local Registers
-f          : Fast Memory Reads

```

All information contained in this document is confidential and proprietary to Concurrent Real-Time. No part of this document may be reproduced, transmitted, in any form, without the prior written permission of Concurrent Real-Time. No license, expressed or implied, under any patent, copyright or trade secret right is granted or implied by the conveyance of this document.

```
-o Offset : Hex offset to read from -- default offset is 0x0
-s Size   : Number of bytes to read in decimal -- default size is 0x4
```

Example display:

```
./ccurpmfc_rdreg -s64
```

```
Device Name: /dev/ccurpmfc0
```

```
LOCAL REGION: Physical Addr=0xc4900000 Size=65536 (0x00010000)

3.1.5 ccurpmfc_reg

This call displays all the boards local and configuration registers.

```
Usage: ./ccurpmfc_reg [-b board]
-b board: Board number -- default board is 0
```

Example display:

```
./ccurpmfc_reg
```

```
Device Name: /dev/ccurpmfc0
```

```
LOCAL REGION: Physical Addr=0xc4900000 Size=65536 (0x00010000)

  03 = enable pci interrupts         04 = get device error
  05 = get driver info              06 = get physical memory
  07 = init board                  08 = mmap select
  09 = mmap(CONFIG registers)      10 = mmap(LOCAL registers)
  11 = mmap(physical memory)        12 = munmap(physical memory)
  13 = no command                  14 = read operation
  15 = remove irq                  16 = reset board
  17 = restore config registers    18 = write operation

Main Selection ('h'=display menu, 'q'=quit)->

```

3.1.8 ccurpmfc_wreg

This is a simple test to write to the local registers at the user specified offset.

```

Usage: ./ccurpmfc_wreg [-b Board] [-C] [-o Offset] [-s Size] [-v Value] [-x]
-b Board   : Board selection -- default board is 0
-C        : Select Config Registers instead of Local Registers
-o Offset  : Hex offset to write to -- default offset is 0x0
-s Size    : Number of bytes to write in decimal -- default size is 0x4
-v Value   : Hex value to write at offset -- default value is 0x0
-x        : Do not read back just written values -- default read back values

```

```

3.1.9 Flash/ccurpmfc_flash

This program is used to burn new firmware. This must only be done at the direction of Concurrent Real-Time support team, otherwise, they could render the board useless.

```
./ccurpmfc_flash -b[Board] -B -F -i -L -q -Q -r[OutFile] -R -v -w[InFile] -X
-b [Board]          : Board number. Must be specified
-B                : Reload Base Level Firmware if MultiFirmware support present
-F                : Force Read Flash: Overwrite output file if exists
-i                : Force Write Flash: Do not abort Flash burn for header label
                  mismatch
-L                : Query chip, on-board flash and InFile if specified
-Q                : Update License only. (default is to update entire firmware)
-q                : Quite (non-interactive) mode
-Q                : Quite (non-interactive) mode. Also dump FPGAWB message
-r                : Read Flash and write to output file created by
                  ./ccurpmfc_flash
-r [OutFile]        : Read Flash and write to output file 'OutFile'
-R                : Reload Firmware at sector address in Flash
-R [SectorNumber]  : Reload Firmware at sector address 'SectorNumber'
-v                : Enable verbose mode
-w [InFile]         : Read input FPGA file and Flash the board
-X                : Use Full File. Do not truncate for firmware write
```

```

=====
Notes =====
Board must be specified. Use '-b' option
Query option '-i' not allowed with '-B', '-R#', '-L', 'r' or '-X' options
Firmware reload '-B' or '-R' not allowed with '-i', '-L', '-r', '-w' or '-X'
options
Firmware read flash '-r' not allowed with '-B', '-i', '-L', '-R', '-w' or '-X'
options
Base Run Level '-B' or '-R#' option not allowed with '-i', '-L', 'r', '-w' or
'-X' options
Must specify write flash option '-w' when License only option '-L' is specified
License only option '-L' not allowed with '-B', '-i', '-R', '-w' or '-X'
options
Don't truncate file option '-X' cannot be selected with the license only update
'-L' option
Don't truncate file option '-X' can only be used with the '-w' option
Inquiry '-i' can be used '-w' options
=====

```

e.g. ./ccurpmfc_flash -b0	(Query chip and on-board Flash)
./ccurpmfc_flash -b0 -i	(Query chip and on-board Flash)
./ccurpmfc_flash -b0 -i -w InFile	(Query chip, on-board Flash and InFile)
./ccurpmfc_flash -b0 -r OutFile	(On-board FPGA ==> OutFile)
./ccurpmfc_flash -b0 -w InFile	(InFile ==> On-board FPGA - use truncated file)
./ccurpmfc_flash -b0 -w InFile -v	(InFile ==> On-board FPGA - use truncated file - verbose)
./ccurpmfc_flash -b0 -w InFile -X	(InFile ==> On-board FPGA - use entire file)
./ccurpmfc_flash -b0 -w InFile -L	(InFile ==> On-board FPGA - only license updated - interactive)
./ccurpmfc_flash -b0 -w InFile -L -q	(InFile ==> On-board FPGA - only license updated - non-interactive)
./ccurpmfc_flash -b0 -R	(Reload Firmware - i.e. power-cycle the card) - Run Level
./ccurpmfc_flash -b0 -B	(Reload Firmware - i.e. power-cycle the card) - Base Level
./ccurpmfc_flash -b0 -R -B	(Reload Firmware - i.e. power-cycle the card) - Base Level
./ccurpmfc_flash -b0 -R 200	(Reload Firmware - i.e. power-cycle the card) - at sector 200

3.1.10 Flash/ccurpmfc_label

This utility is only supplied for those customers that are creating their own firmware and need to install in on a RedHawk system. In its simplest form, the customer will request a License from Concurrent Real-Time for the option to burn their custom firmware. The license file (*.lic) supplied by Concurrent Real-Time, along with the customer firmware (*.rpd) file will be supplied to this utility to create a burnable FPGA file (*.cust), that will be supplied to the *ccurpmfc_flash* utility to burn the firmware on the card.

```

./ccurpmfc_label -d[OutputDirectory] -c[ChipName] -F -i[InputFile]
                  -L[LicenseFile] -m[MemberCode] -o[OutputFile]
                  -S[RunLevelSectorAddress] -t[Tag]

-d [OutputDirectory]      : Directory to use for Output File
-c [ChipName]            : Chip Name. One of:
                           EPCQ16 EPCQ32 EPCQ64 EPCQ128 EPCQ256 EPCQ512
                           (This option is mandatory if not specified in
                           license file)
-F                      : Force overwriting of output file if it exists
-i [InputFile]           : Raw input file. (.rpd extension)
-L [LicenseFile]         : License file (.lic extension) to restrict firmware
                           access (this option is mandatory)

```

All information contained in this document is confidential and proprietary to Concurrent Real-Time. No part of this document may be reproduced, transmitted, in any form, without the prior written permission of Concurrent Real-Time. No license, expressed or implied, under any patent, copyright or trade secret right is granted or implied by the conveyance of this document.

```

If '-i' option is not specified, the license file is
dumped to stderr
-m [MemberCode] : Specify Member Code (A1,A3,A5,A7,B1,B3,B5,B7)
                  (This option is mandatory if not specified in
                   license file)
-o [OutputFile] : Use output file instead of the default file created
                  by the program
-S [RunLevelSectorAddress] : Run Level Sector Address. (This option is mandatory
                            if not specified in license file)
                            : S0=Base Level, S#=Run Level Number
-t [Tag] : Insert this tag name in the default file created by
            the program

===== Notes =====
- Options '-L' is required. If option '-i' is not specified, license file is
  dumped
- Options 'c', '-m' and '-S' are required if they have not already been defined
  in LicenseFile
- You cannot specify a Run Level Sector '-S' with Single Level Firmware '-1'
  option
- Run Level Sector address of zero '-S0' represents the Base Level Firmware in
  Multi-Firmware support
- If option '-o' is not specified, the created customer FPGA file name will be as
  follows:
    <OutputDirectory>/<InputFile>_<Tag>_<Function>_<ChipName><MemberCode><RunLevel>.cust

e.g. ./ccurpmfc_label -iraw_file.rpd -L LicenseFile.lic (in its simplest form)
      (output file created is: 'raw_file <Function> <ChipName><MemberCode><RunLevel>.cust')
./ccurpmfc_label -L LicenseFile.lic (this will display licensing information)
./ccurpmfc_label -iraw_RUN_file.rpd -ooutput_file.cust -S100 -L LicenseFile.lic
./ccurpmfc_label -iraw_SINGLE_file.rpd -L LicenseFile.lic
./ccurpmfc_label -iraw_RUN_file.rpd -ooutput_file.cust -S200 -L LicenseFile.lic
./ccurpmfc_label -iraw_BASE_file.rpd -S0 -L LicenseFile.lic
      (Will cause firmware to be loaded at start offset Base Run Level)

```

3.1.11 Flash/ccurpmfc_dump_license

This utility is allows the customer to dump the license information from a firmware (*.cust) file.

```
./ccurpmfc_dump_license <Firmware file>
```

This utility only dumps the license information from the *.cust file
and **not** the *.lic license file

```
e.g. ./ccurpmfc_dump_license COS_IpCoreCOS_EPCQ256A5S100.cust
```

3.2 Application Program Interface (API) Access Example Tests

These set of tests are in the .../test/lib directory and use the API.

3.2.1 lib/ccurpmfc_adc

This test performs validation of the Multi-Function ADC card.

```
Usage: ./ccurpmfc_adc [-A] [-a RollingAve] [-b BoardNo] [-C AdcUpdateClock]
                      [-d Delay] [-D DMAEngine] [-E ExpInpVolt] [-f DataFormat]
                      [-F DebugFile] [-i] [-l LoopCnt] [-m XferMode]
                      [-n NumChans] [-N] [-s InputSignal] [-t Compare]
                      [-T TestBus] [-V MaxBoardVolts]
-A                               (Perform Auto Calibration first using reference voltage)
-a RollingAve                  (Rolling average -- default "==== None ===")
-b BoardNo                      (Board number -- default is 0)
-C AdcUpdateClock               (select ADC update clock, 0..6 or 'n|N')
      -C 0,6                     (Ch0..7=Clock0, Ch8..15=Clock6 at MAX SPS)
      -C 6@20000.0/n             (Ch0..7=Clock6 at 20000 SPS, Ch8..15=No Clock)
      -C 4                        (Ch0..15=Clock4 at MAX SPS)
      -C 4@150000.0              (Ch0..15=Clock4) at 150000 SPS
-d Delay                         (Delay between screen refresh -- default is 0
                                         milli-seconds)
-D DMA Engine                   (DMA Engine number -- default = 1)
-E <ExpInpVolts>@<Tol>
      +@<Tol>                  (Expected Input Volts@Tolerance -- default Tol=0.003000)
      -@<Tol>                  (Positive Calibration Ref Volt@Tolerance)
      (Negative Calibration Ref Volt@Tolerance)
-f DataFormat                    (select data format, '2' or 'b')
      -f b,2                     (Ch0..7=Offset binary, Ch8..15=Two's complement)
      -f 2/b                     (Ch0..7=Two's complement, Ch8..15=Offset binary)
      -f b                        (Ch0..15=Offset binary)
-F DebugFile                    (Debug file with menu display -- default "==== None ===")

3.2.2 lib/ccurpmfc_adc_calibrate

This test is useful for performing, saving and restoring ADC calibration.

```

Usage: ./ccurpmfc_adc_calibrate [-A] [-b board] [-i inCalFile] [-o outCalFile]
  -A                      (perform Auto Calibration)
  -b <board>              (board #, default = 0)
  -i <In Cal File>       (input calibration file [input->board_reg])
  -o <Out Cal File>      (output calibration file [board_reg->output])

e.g. ./ccurpmfc_adc_calibrate                               (Dump calibration information to
                                                               stdout)
  ./ccurpmfc_adc_calibrate -A -o Calfile (Perform Auto calibration and dump
                                               information to 'Calfile')
  ./ccurpmfc_adc_calibrate -i Calfile   (Update board calibration with
                                               supplied 'Calfile')

```

Example display:

```

./ccurpmfc_adc_calibrate -A

Device Name      : /dev/ccurpmfc0
Board Serial No: 98765 (0x000181cd)
Auto Calibration started...done. (2.067 seconds)

3.2.4 lib/ccurpmfc_clock

This is a useful tool to display information of the various clocks and also program them.

```
Usage: ./ccurpmfc_clock [-b BoardNo] [-C UpdateClock] [-d Delay] [-l LoopCnt]
-b BoardNo          (Board number -- default is 0)
-C <Clock>@<Frequency> (set update clock '0..6' with frequency )
-d Delay           (Delay between screen refresh -- default is 10 milli-
                     seconds)
-l LoopCnt         (Loop count -- default is 0)
-R                (Reset/Clear all clocks)

e.g. ./ccurpmfc_clock -C 1@300000
                           (Set Clock 1 to 300000 SPS - do not change any other
                            running clocks)
./ccurpmfc_clock -R -C0@100000 -C4@12345
                           (Reset all clocks and then set Clock 0 to 100000 SPS and
                            Clock 4 to 12345 SPS)
```

Example display:

```
./ccurpmfc_clock -R -C0@100000 -C4@12345
```

```

3.2.5 lib/ccurpmfc_dac

This test is useful in programming the DAC interface and displaying the DAC registers.

```
Usage: ./ccurpmfc_dac [-A] [-a RollingAve] [-b BoardNo] [-C AdcUpdateClock]
                      [-d Delay] [-D DMAEngine] [-E ExpInpVolt] [-f DataFormat]
                      [-F DebugFile] [-l LoopCnt] [-n NumChans] [-o OutputSelect]
                      [-s InputSignal] [-v DacVoltage] [-V OutputRange] [-Z]
-A                               (Perform DAC Auto Calibration first using reference
                                voltage)
-a RollingAve                  (Rolling average -- default "==== None ===")
-b BoardNo                      (Board number -- default is 0)
-C AdcUpdateClock               (select ADC update clock, 0..6 or 'n')
                                (-C 0,6
                                -C 6@20000.0/n
                                -C 4
                                -C 4@150000.0)
-d Delay                         (Delay between screen refresh -- default is 0 milli-
                                seconds)
-D DMA Engine                   (DMA Engine number -- default = 1)
-E <ExpInpVolts>@<Tol>       (Expected Input Volts@Tolerance -- default Tol=0.006000)
                                +@<Tol>
                                -@<Tol>
                                c@<Tol>
Note:                           (For differential bipolar, even channels, voltage read
                                is half supplied)
                                (For differential bipolar, odd channels, voltage read is
                                neg. half supplied)
                                (select DAC data format, '2' or 'b')
                                (Ch0..3=Offset binary, Ch4..15=Two's complement)
                                (Ch0..3 & Ch8..15=Two's complement, Ch4..7=Offset
                                binary)
                                (Ch0..15=Offset binary)
-F DebugFile                    (Debug file with menu display -- default "==== None ===")
                                #DebugFile
                                @DebugFile
                                @ or #

3.2.6 lib/ccurpmfc_dac_calibrate

This test is useful for performing, saving and restoring DAC calibration. If calibration ‘-A’ is specified along with voltage ‘-V’, the board voltage range will first be programmed prior to initiaing calibration.

```
Usage: ./ccurpmfc_dac_calibrate [-A] [-b board] [-c ChanMask] [-f DataFormat]
                                 [-i inCalFile] [-o outCalFile] [-V MaxBoardVolts]
-A                               (perform Auto Calibration)
-b <board>                   (board #, default = 0)
-c <ChanMask>                (channel selection mask, default = all channels)
-f DataFormat                 (select DAC data format, '2' or 'b')
-f b,2                        (Ch0..3=Offset binary, Ch4..15=Two's complement)
-f 2/b,2                      (Ch0..3 & Ch8..15=Two's complement, Ch4..7=Offset binary)
-f b                          (Ch0..15=Offset binary)
-i <In Cal File>            (input calibration file [input->board_reg])
-o <Out Cal File>           (output calibration file [board_reg->output])
-V MaxBoardVolts             (Voltage range)
-V u10,b10                    (Ch0..3=UniPolar 10V, Ch4..15=BiPolar 10V)
-Vb5/b10,u20                  (Ch0..3=BiPolar 5V, 4..7=BiPolar 10V, 8..15=UniPolar 20V)
-V b10                        (Ch0..15=BiPolar 10V)

e.g. ./ccurpmfc_dac_calibrate          (Dump calibration information to
                                         stdout)
     ./ccurpmfc_dac_calibrate -A -o Calfile (Perform Auto calibration and dump
                                         information to 'Calfile')
     ./ccurpmfc_dac_calibrate -i Calfile   (Update board calibration with
                                         supplied 'Calfile')
```

Example display:

```
./ccurpmfc_dac_calibrate -A -oOutputCal

Device Name      : /dev/ccurpmfc0
Board Serial No: 98765 (0x000181cd)
Auto Calibration started...done. (2.527 seconds)

-F FallCh           (Falling Edge Channel_List)
-l LoopCnt           (Loop count -- default is 0)
-L LevelCh           (Level State Channel_List)
-R RiseCh            (Rising Edge Channel_List)
-X DeleteCh          (Delete COS Channel_List)

Examples of Channel_List. Unchanged channels default to Level State Channels:
-F -                (set all DIO channels to falling edge)
-R 1,2,7,9          (set channels 1,2,7,9 to rising edge, rest are level state
-X 5,7-12           (delete channels 5, and 7 to 12. rest are level state

```

Example display:

In the example below, a signal generator is connected to digital input channels 0, 1, 32 and 64. A 15 KHz, +5/0 volts square wave is injected into the selected channels. The test is run using shielding and directing to CPU 4 and 5 and driver interrupt directed to CPU 2. The reason the display shows approximately 30 KHz rate is because the test defaults to performing level detection, i.e. detecting both rising and falling edge on all channels. Depending on other activities in the system, it is possible to see some Overflow conditions.

In order to run at such high rates without getting overflow or missing user callbacks requires proper shielding and real time running of the test. Additionally, the driver interrupt handler needs to be directed to a dedicated processor in order to minimize overflows. E.g.

```
# === as root ===
# shield -a 2,4-5                                (shield processors 2, 4 and 5)
# cat /proc/ccurpmfc                            (get board irq – in this case it is ‘irq=56’)
# echo 4 > /proc/irq/56/smp_affinity          (direct board irq to be handled by processor 2)
# (if irq ‘56’ is not present in the proc/irq directory, then you will need to start the test at least once to get it assigned by the kernel)
# run -b4-5 ./ccurpmfc_dio_intr
```

```

Destroying User COS Interrupt Handler
-----
```

```
./ccurpmfc_dio_intr -F0,32 -R64
```

In this example, we are detecting the falling edge for channels 0 and 32, rising edge for channel 64 and level detection for the rest of the channels. This is why you will see the count for channel 1 (level detection) double that of channels 0, 32 and 64.

```

3.2.10 lib/ccurpmfc_disp

Useful program to display the local board registers. This program uses the *curses* library. This test is similar to the previous non-library test.

```

Usage: ./ccurpmfc_disp [-b Board] [-d Delay] [-D DMAEngineNo] [-H] [-i]
                      [-l LoopCnt] [-m XferMode] [-o Offset] [-P Pause]
                      [-s XferSize] [-S DispSize]
-b Board          (Board number -- default board is 0)
-d Delay          (Delay between screen refresh -- default is 0)
-D DMAEngineNo   (DMA Engine number -- default = 1)
-H               (Enable Hyper-Drive Mode -- default "==== Disabled ===")
-i               (Enable Interrupts -- default = Disable)
-l LoopCnt        (Loop Count - default = 0)
-m XferMode       (Transfer Mode -- default = DMA)
      -md          (Avalon Memory: DMA mode)
      -mm          (Avalon Memory: Modular Scatter-Gather DMA mode)
      -mp          (Avalon Memory: Programmed I/O mode)
      -mS          (SDRAM Memory: DMA mode)
      -ms          (SDRAM Memory: Programmed I/O mode)
-o Offset         (Hex offset to read from -- default is 0x0)
-P Pause          (Microseconds to sleep in User Function loop -- default is 0)
-s XferSize       (Number of bytes to transfer -- default is 0x1000)
-S DispSize       (Number of bytes to display -- default is 0x200)

```

Example display:

```

./ccurpmfc_disp

```

3.2.11 lib/ccurpmfc_dma

This test transfers data from physical memory to the Local register area and back. There are two modes of operation. One is DMA and the other is programmed I/O. Depending on the number of DMA engines supported by the card, the user can select one of them to perform the DMA. Area select is one of three areas the user can specify. They represent the area in physical memory and local register where the transfer is to occur. The test automatically switches to a different area corresponding to the DMA engine supplied. If multiple copies of this application is run on the same card using the same DMA engine, then the user needs to manually select a different area ‘-A’ so the data mismatch does not occur due to using the same area region.

```

Usage: ./ccurpmfc_dma [-A Area2Select] [-b Board] [-D DMAEngineNo] [-i]
                      [-l LoopCnt] [-m XferMode] [-s Size] [-v VerboseNo]
-A Area2Select (Area to select -- default = -1)
-b Board        (Board number -- default = 0)
-D DMAEngineNo (DMA Engine number -- default = 0)
-i             (Enable Interrupts -- default = Disable)
-l LoopCnt     (Loop Count - default = 1000)
-m XferMode    (Transfer Mode -- default = DMA)
  -md          (DMA mode)
  -mp          (Programmed I/O mode)
-s Size         (Transfer Size in bytes (multiple of byte width) -
                  default = 12288)
-v VerboseNo   (verbose -- default = 0)

e.g. ./ccurpmfc_dma -A1      (perform dma using DMA0 on area 1 )
      ./ccurpmfc_dma -i -D1 (perform dma using DMA1 with interrupts on area 0)

```

Example display:

```
./ccurpmfc_dma
```

```
Device Name: /dev/ccurpmfc0
```

./ccurpmfc_expires -s (for restricted card that has expiration date)

Restricted: Expire in 10550462 seconds

```

3.2.14 lib/ccurpmfc_identify

This test is useful in identifying a particular card by displaying its LED.

```

Usage: ./ccurpmfc_identify -[bsx]
      -b <board>          (board #, default = 0)
      -s <seconds>         (seconds to sleep, default = 10)
      -s 0                 (Identify Board: DISABLE)
      -s <negative value> (Identify Board: ENABLE forever)
      -x                  (silent)

```

Example display:

```
./ccurpmfc_identify
```

```

Device Name      : /dev/ccurpmfc0
Board ID        : 9290
Board Type      : 01

```

All information contained in this document is confidential and proprietary to Concurrent Real-Time. No part of this document may be reproduced, transmitted, in any form, without the prior written permission of Concurrent Real-Time. ```

Board Function : 01
Board Serial No: 98765 (0x000181cd)

Identify ENABLED on board 0 (LED should start flashing)
Sleeping for 10 seconds...done
Identify DISABLED on board 0 (LED should stop flashing)

```

3.2.15 lib/ccurpmfc_info

This test is useful in getting information for all the *ccurpmfc* devices in the system.

```

Usage: ./ccurpmfc_info -[b Board] -[l] -[v]
      -b <board>          (board #, default = 0)
      -l                  (long display, default = short)
      -v                  (long display and verbose, default = no verbose)
      -l -v               (long display and verbose, default = no verbose)

```

Example display:

```
./ccurpmfc_info
```

```

```

3.2.16 lib/ccurpmfc_msdma

This test performs a modular scatter-gather DMA test on boards that support it. Additionally, it displays performance information for each mode of operation.

```

Usage: ./ccurpmfc_msdma [-a AddrOff,ToAddrOff] [-b Board] [-d NumDesc]
                        [-f Input,Output] [-i] [-l LoopCnt] [-m Mode]
                        [-s TotalXferSize] [-v] [-X]
    -a <AddrOff,ToAddrOff> (First Avalon Address Offset, default DiagRam
                                offset)
                                (Second 'ToAddrOff' only for Avalon2Avalon mode
                                offset)
    -b <Board>             (board #, default = 0)
    -d <NumDesc>           (Number of Descriptors, default = 2)
    -f <Input>,<#Output>   (Use input file as input data. default None)
                            (Use Output file to write 'to' data. default
                            None)
                            (Prepend with '#' to remove comments and
                            address)
    -i                      (Use interrupts, default is poll)
    -l <LoopCnt>           (Loop Count, default = 1000)
    -m <Mode>               (Mode of Operation, default = all)

```

All information contained in this document is confidential and proprietary to Concurrent Real-Time. No part of this document may be reproduced, transmitted, in any form, without the prior written permission of Concurrent Real-Time. No license, expressed or implied, under any patent, copyright or trade secret right is granted or implied by the conveyance of this document.

```

'a2p'          (Avalon to Pci)
'p2a'          (Pci to Avalon)
'p2p'          (Pci to Pci)
'a2a'          (Avalon to Avalon)
'all'          (All modes)
-s <TotalXferSize> (Total Transfer Size, default size of DiagRam)
-v             (Verbose operation. default is quiet)
-X             (Skip Data Validation, default is to validate)

```

Notes:

- 1) For modes 'p2a' or 'a2p' only the first address 'AddrOff' used in option '-a'
- 2) For modes 'a2a' the first address 'AddrOff' is "FROM" and second address
'ToAddrOff' is "TO"
- 3) If Input file is specified in the '-f' option, its contents is used to seed
input
- 4) If '-X' option is specified, no pattern is written to input, unless '-f
Input' option is specified
- 5) Multiple '-m' options can be specified on a single command line
- 6) When address '-a' option is not specified, DiagRam offset is used for Analog
input/output
- 7) Normal running process if no arguments specified is as follows:
 - a) Incrementing pattern written to the input using programmed I/O and
readback validated
 - b) Output written with 'baadbeef' pattern using programmed I/O
 - c) Scatter-Gather DMA performed from Input to Output
 - d) Data is read back from both Input and Output using programmed I/O and
compared

```

e.g. ./ccurpmfc_msgdma -mall           (Run all transfer modes with
                                validation)
./ccurpmfc_msgdma -a0x8000 -s0x100     (Run all modes with Avalon
                                Address 0x8000 and size 0x100)
./ccurpmfc_msgdma -a0xA000 -s0x200 -ma2a (Run a2a with Avalon Address
                                0xA000 and size 0x200)
./ccurpmfc_msgdma -mp2a -l1 -d1 -fHexFile_16K -a0x10004 -X
                                (Transfer Input file to Avalon memory at
                                0x10004)
./ccurpmfc_msgdma -ma2p -l1 -d1 -f,OutFile -s0x4000 -a0x10004 -X
                                (Transfer Avalon memory at 0x10004 to output
                                file 'OutFile')

```

Example display:

./ccurpmfc_msgdma

```

1000: P2P Total: Size 0x8000, Fire= 109.77us ( 298.53 MB/s) (mi/ma/av

```

3.2.17 lib/ccurpmfc_msgdma_info

This test provides useful modular scatter-gather DMA information for cards that support it.

```

Usage: ./ccurpmfc_msgdma_info [-b Board] [-l]
                               -b <Board>          (board #, default = 0)

```

```

3.2.18 lib/ccurpmfc_transfer

This test performs various DMA and Programmed I/O transfers between the board components and the PCI memory.

```

Usage: ./ccurpmfc_transfer [-b Board] [-c CaseNum] [-i] [-l LoopCnt]
                           [-s XferSize]
-b Board      (Board number -- default is 0)
-c CaseNum   (Select Case Numbers -- default = ALL CASES)
  -c 4,1,7-9 select case 1,4,7,8,9)
  -c 8-       select case 8 to end)
  -c -3      select case 1,2,3)
-i           (Enable Interrupts -- default = Disable)
-l LoopCnt   (Loop Count -- default is 100)
-s XferSize  (Avalon Ram Xfer Size in bytes -- default is 32768)

```

Example display:

./ccurpmfc_transfer (for cards with modular scatter-gather DMA support)

```

3.2.20 lib/IpCore/ccurpmfc_ipcore_cos

This program demonstrates the features of the IP Core Change of State card.

```

Usage: ./ccurpmfc_ipcore_cos [-b Board] [-c ChannelMask] [-d Delay]
                               [-D DMAEngineNo] [-F DebugFile] [-l LoopCnt]
                               [-m XferMode] [-n Element2Display] [-T TestNumber]
                               [-V VerifyPattern] [-w Control] [-x]

-b Board                  (Board number -- default board is 0)
-c ChannelMask           (select channels mask)
  -c0@XXXXXXXXXX          (Channels 31..00=XXXXXXXX in Hex)
  -c1@XXXXXXXXXX          (Channels 63..32=XXXXXXXX in Hex)
-d Delay                  (Delay in milli-secs between screen refresh -- default is 0)
-D DMAEngineNo            (DMA Engine number -- default = 1)
-F DebugFile              (Debug file with menu display -- default "==== None ===")
  @DebugFile               (Debug file without display)
  @                         (No debug file and no display)
-l LoopCnt                (Loop Count - default = 0)
-m XferMode               (Transfer Mode -- default = DMA)
  -md                      (Library ccurPMFC_Transfer_Data(): DMA mode)
  -mp                      (Library ccurPMFC_Transfer_Data(): Progammed I/O mode)
-n Element2Display         (Number of Elements to Display -- default is 128)
-T TestNumber              (Execute Self test 0=alternate or 1=increment pattern)
  -T0                      (Atternate pattern test -- AAAAAAAA/55555555)
  -T1                      (Increment pattern test)
-V VerifyPattern           (Verify capture rate, increment or alternate test pattern)
  -Vr                      (compute capture rate)
  -Vp                      (verify increment or alternate test pattern (-winc or -walt))
-w Control                 (select control: Normal/Test(increment/alternate pattern,
                           div=1,2,4,8,16,32,64,128), Start/Stop
                           -wte -wsta             (select 'test' mode and 'start' capture)
                           -wn -wStop              (select 'normal' mode and 'stop' capture)
                           -walt -wtest             (select 'alternation - 5555/AAAA' and 'test' mode capture)
                           -winc -wtest             (select 'increment - 5555/AAAA' and 'test' mode capture)
                           -winc -wl28 -wtest       (select 'increment - 5555/AAAA' and 'test' mode capture with
                           time divider of 128)
-x                         (Skip decoding of timestamp)

e.g. ./ccurpmfc_ipcore_cos -c0@fffff -c1@fffff0000 -wtest -wstart (select channels
                           00..15 and 63..48, test mode, start capture)
  ./ccurpmfc_ipcore_cos -c0@ffffffff -c1@ffffffff -wtest -walt -wstart -Vp
                           (verify alternate 5555/AAAA pattern)
  ./ccurpmfc_ipcore_cos -T0 (verify alternate 5555/AAAA pattern)
  ./ccurpmfc_ipcore_cos -T1 (verify increment pattern test)

```

Example display:

```
./ccurpmfc_ipcore_cos -b1 -T1
```

```

```

3.2.21 lib/Sprom/ccurpmfc_sprom

This is a simple program to demonstrate sprom access.

```

Usage: ./ccurpmfc_sprom [-b board] [-C] [-D] [-S serialNo]
-b <board>           (Board #, default = 0)
-C                   (Clear ENTIRE serial PROM first)
-D                   (Dump entire serial prom)
-S <serialNo>         (Program board serial number)

e.g. ./ccurpmfc_sprom -C          -> Clear Entire Serial Prom First
     ./ccurpmfc_sprom -D          -> Dump Entire Serial Prom
     ./ccurpmfc_sprom -S 12345678 -> Write Serial Number

```

Example display:

./Sprom/ccurpmfc_sprom

```

Device Name:          /dev/ccurpmfc0
Board Serial Number: 12345 (0x00003039)
Serial PROM Revision: 0 (0x0000)

```
